

High Grade Phase 3 Drill Results Significantly Expand Prop Prospect Potential

OD6 Metals Limited (**OD6** or the **Company**) is pleased to report initial assay results for Phase 3 drilling at its Splinter Rock clay hosted rare earth element (**REE**) Project, located northeast of Esperance in Western Australia.

Highlights:

- Outstanding initial assay results from **78 holes** of the completed **145-hole program**.
- Grades of up to **4,159 ppm** Total Rare Earth Oxides (**TREO**) returned, with **extensive clay thickness of up to 56m** at consistently high grades.
- Clays confirmed across a **11km length** at Prop with widths between **4 to 5km**.
- Returned assays in **61%** of holes show grades in excess of **1,000ppm TREO**.
- High value Magnet Rare Earth Oxides (**MREO**) represent an average of ~**21%** of TREO grade.
- Drill results **strongly correlate** with interpreted data from **Airborne Electromagnetic Survey (AEM)**, validating geological modelling and exploration program design.
- Real and substantial potential for Mineral Resource expansion based on these results.
- Pending assay results at Centre are expected to be progressively received over the coming weeks.
- All assays using **4-acid soluble digestion** (i.e. does not assay for resistate non-acid soluble REE minerals).
- The Phase 3 drill program received funding through the Western Australian Government's Exploration Incentive Scheme Co-funded drilling program.

Significant high-grade clay-hosted rare earth intersections include:

- **56 metres** at 1,111ppm TREO (23.40% MREO) from surface (SRAC0406)
 - Including **30 metres** at 1,646ppm TREO (24.0% MaREO) from 24 meters
- **40 metres** at 1,308ppm TREO (21.9% MREO) from 21 metres (SRAC0377)
 - Including **28 metres** at 1,646ppm TREO (21.8% MREO) from 33 metres
- **36 metres** at 1,206ppm TREO (22.7% MREO) from 30 metres (SRAC0410)
- **25 metres** at 1,257ppm TREO (25.7% MREO) from 15 metres (SRAC0408)
- **37 metres** at 1,143ppm TREO (23.3% MREO) from 45 metres (SRAC0425)
- **27 metres** at 1,141ppm TREO (23.2% MREO) from 51 metres (SRAC0401)
- **33 metres** at 1,065ppm TREO (21.9% MREO) from 21 metres (SRAC0398)
- **14 metres** at 1,628ppm TREO (23.8% MREO) from 27 metres (SRAC0432)

Brett Hazelden, Managing Director, commented:

"These outstanding drill results have further confirmed the high-grade clay hosted rare earth nature of the Prop Prospect. With the combination of clay thicknesses of up to 56m, grades in excess of 1,000ppm Total Rare Earth Oxides (TREO), and consistency across several kilometres of width and length, the Prop Prospect continues to validate this globally significant discovery.

It is important to recognise how materially these results expand the extent of the current footprint of high-grade mineralisation at the Prop Prospect, offering real and substantial potential for resource expansion.

Results remain outstanding for 67 holes of the drilling program at our Centre Prospect, which also stepped out from the existing extent of the MRE boundary. We are eagerly awaiting these assay results and expect them to be progressively received over the coming weeks.

OD6 is grateful for the continued support from the Department of Mines, Industry Regulation and Safety whose funding, via the Exploration Incentive Scheme, helped facilitate the expedition of this drill program."

**High Grade
Clay Hosted
REEs Over
Massive Area**

Phase 3 Aircore drilling recently completed at the Splinter Rock Project was designed to test the localised consistency of clay type, thickness and grades at the Centre and Prop Prospect areas (refer Figure 1 and 2). A total of 145-holes for 7,435m were drilled at an approximate average depth of 51m and maximum depth of 104m at a 400m spacing interval.

Assay results covering all 78 holes at the Prop Prospect have now been received. Importantly, 96% of holes encountered clays with rare earth concentrations >300ppm TREO, with 61% of holes intercepting rare earth concentrations >1,000ppm TREO.

Grades of up to 4,159 ppm TREO were returned, with extensive clay thickness of up to 56m with consistency of grade throughout. Phase 3 drilling confirmed clays across a 11km length at Prop with widths between 4 to 5km (refer Figure 2). High value MREO represent an average of ~21% of TREO grade.

Drill results strongly correlate with interpreted data from AEM, validating geological modelling and exploration program design.

Geological drill assays at Splinter Rock were performed utilising the ALS 4-acid soluble digestion method as opposed to the ALS Lithium Borate Fusion Digest method. Typically, the Fusion Digest method returns results for resistate (refractory) non-acid soluble REE minerals, thus inflating the overall TREO grade.

Previous work conducted by OD6 showed that utilising the fusion digest assay technique can increase head grade by up to 30% over a 4-acid leach assay. This extra grade however is highly unlikely to be recoverable in the proposed processing flowsheet.

The Phase 3 drill program received funding through the Western Australian Governments Exploration Incentive Scheme Co-funded drilling program (refer ASX Announcement, [24 April 2023](#)).

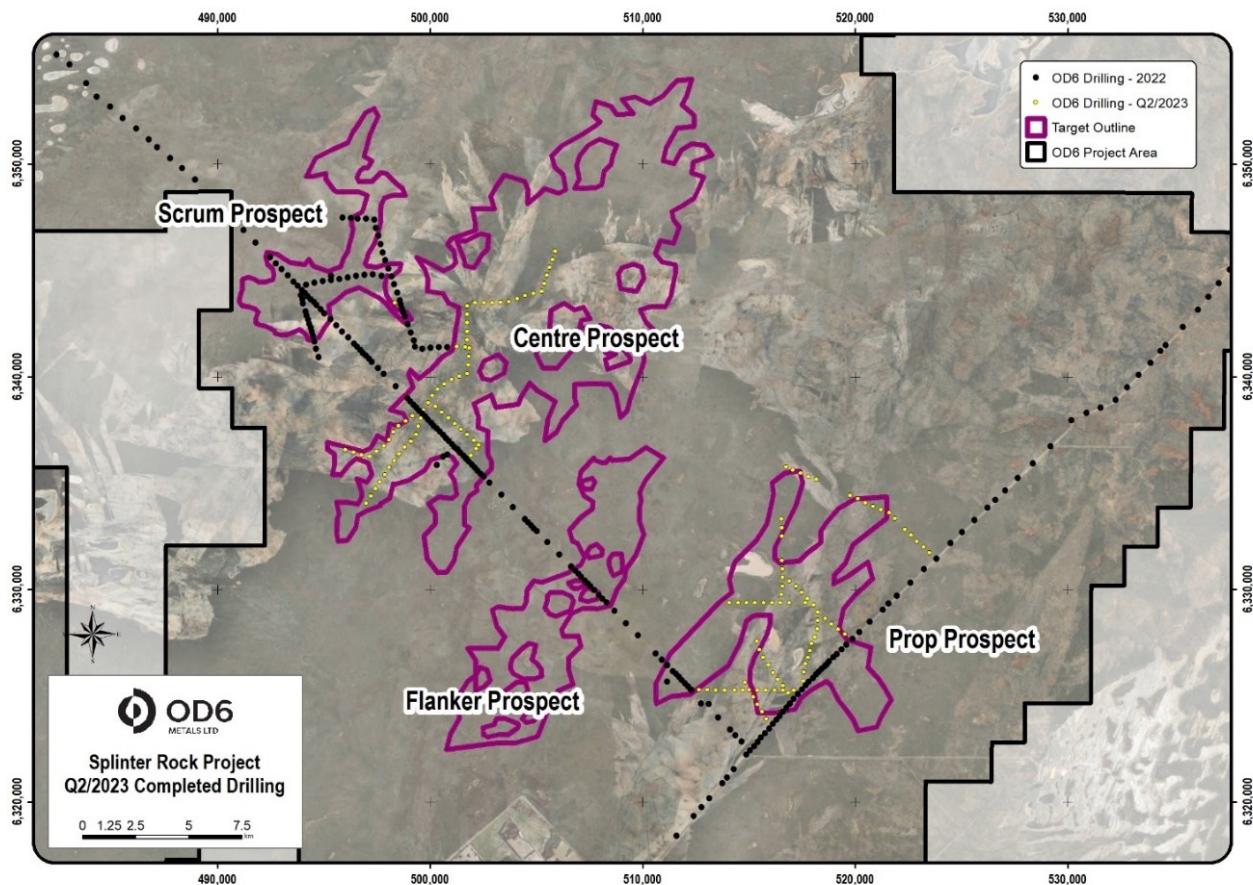

Figure 1: Splinter Rock Project completed drilling locations.

**Real and
Substantial
Potential for
Resource
Expansion**

The current Splinter Rock Maiden Inferred Mineral Resource Estimate stands at 344Mt @ 1,308ppm TREO at 1,000ppm cut-off grade @ 22.8% MREO.

The Prop Prospect represents 33Mt @ 1,180ppm TREO at 1,000ppm cut-off grade @ 20.7% MREO of the Splinter Rock MRE.

The black outline on Figure 2 represents the current extent of the Mineral Resource Estimate (**MRE**) at the Prop Prospect (refer ASX Announcement, [18 July 2023](#), OD6 confirms that it is not aware of any new information or data that materially affects the information included in those releases. All material assumptions and technical parameters underpinning those releases continues to apply and has not materially changed). This area takes in only 2.6km² of the 58km² total Prospect. Phase 3 drilling expanded into the broader area with new high grade drill lines demonstrating a real and substantial potential for resource expansion.

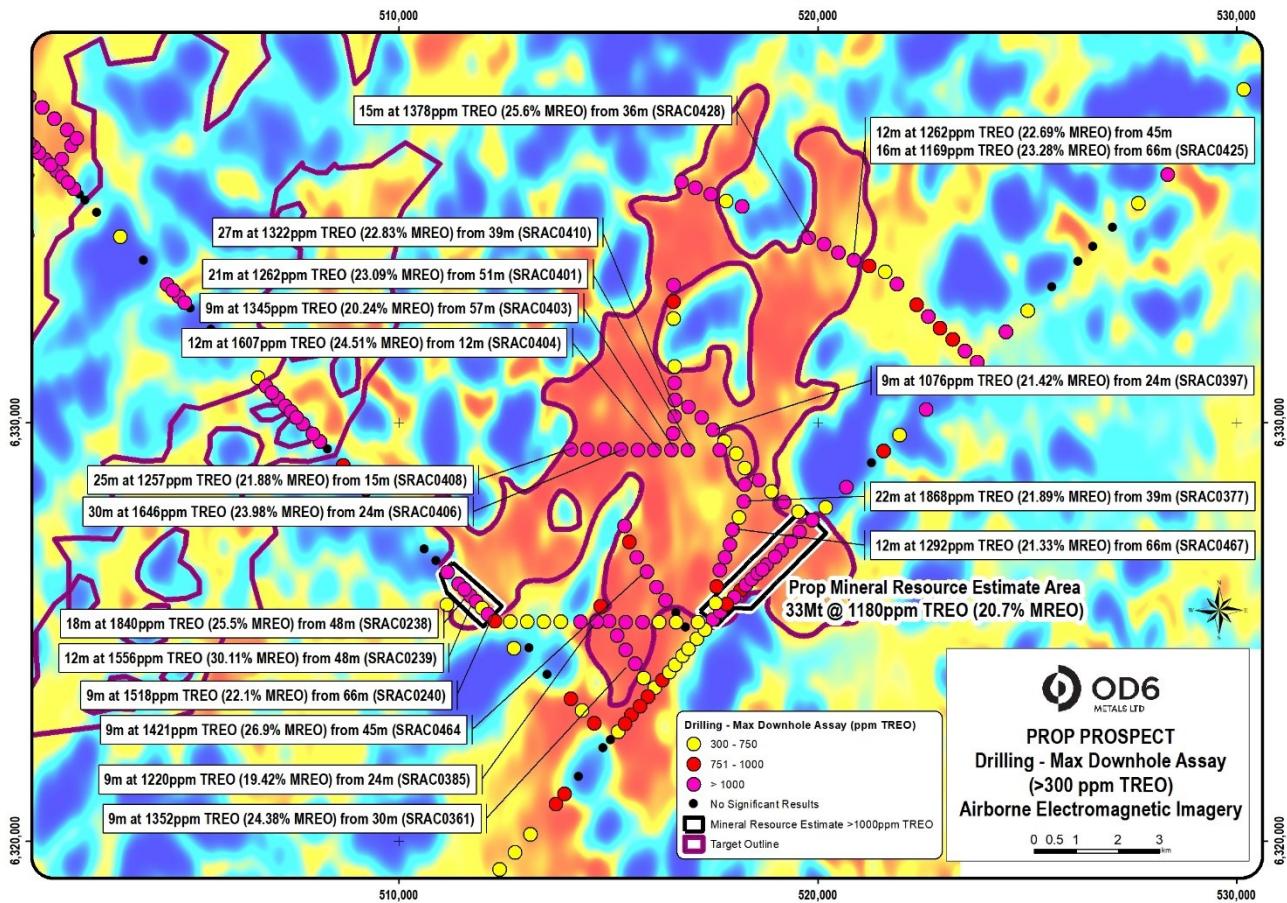

Figure 2: Splinter Rock Project, Prop Prospect Drilling Results. Showing max down hole assay, overlaid on the AEM Mid time electromagnetic conductivity model. Orange and red areas are interpreted to indicate thicker clay zones, with blue, green and yellow areas the granites. Refer to ASX Announcement, [15 December 2022](#).

Splinter Rock clay hosted REE mineralisation

Splinter Rock clay hosted REE mineralisation is currently thought to be a mobilised weathering product of the REE enriched Booanya granite suite, which underlies the Project area. OD6 has identified four prospect areas from drilling and geophysics that contribute to the Mineral Resource Estimate, of which Prop is one of these prospects.

The Prop Prospect is located at the lowest elevation and is surrounded by Booanya Granites to the north and south and is interpreted to be a glacial paleo-valley filled with clay. The prospect area has been formed from OD6's digital elevation model, recent mid-time AEM preliminary imagery and CSIRO modelled historic AEM combined with the results of existing drilling. Drilling indicates that REEs occur in thick clay areas that vary between 10m to 80m with TREO assay intercepts up to 4,159ppm. Variable transported cover and upper saprolitic clays occur to approximately 3m to 24m thickness above the rare earth clay hosts. The target area covers 58km² and extends approximately 11km along axis and up to 5km wide. Initial Metallurgical acid leach tests achieved 44% to 96% recovery of MREE (average 71%).

Program timeline

- Centre Prospect drill assays are expected to be received during September and October 2023.
- Metallurgical testing and mineralogy assessments at ANSTO expected to be received during October 2023.
- A review and potential upgrade of the Mineral Resource Estimate is expected during Q4 2023.

Competent Persons Statement

Information in this report relating to Exploration Results is based on information reviewed by Jeremy Peters, who is a Fellow of the Australasian Institute of Mining and Metallurgy and a Chartered Professional Geologist and Mining Engineer of that organisation. Mr Peters is an independent consultant of Burnt Shirt Pty Ltd and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Peters consents to the inclusion of the data in the form and context in which it appears.

No new information

Except where explicitly stated, this announcement contains references to prior exploration results, all of which have been cross-referenced to previous market announcements made by the Company. The Company confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements.

Forward Looking Statements

Certain information in this document refers to the intentions of OD6 Metals, however these are not intended to be forecasts, forward looking statements, or statements about the future matters for the purposes of the Corporations Act or any other applicable law. Statements regarding plans with respect to OD6 Metals projects are forward looking statements and can generally be identified by the use of words such as 'project', 'foresee', 'plan', 'expect', 'aim', 'intend', 'anticipate', 'believe', 'estimate', 'may', 'should', 'will' or similar expressions. There can be no assurance that the OD6 Metals plans for its projects will proceed as expected and there can be no assurance of future events which are subject to risk, uncertainties and other actions that may cause OD6 Metals actual results, performance, or achievements to differ from those referred to in this document. While the information contained in this document has been prepared in good faith, there can be given no assurance or guarantee that the occurrence of these events referred to in the document will occur as contemplated. Accordingly, to the maximum extent permitted by law, OD6 Metals and any of its affiliates and their directors, officers, employees, agents and advisors disclaim any liability whether direct or indirect, express or limited, contractual, tortious, statutory or otherwise, in respect of, the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

This announcement has been authorised for release by the Board of OD6 Metals Limited

About OD6 Metals

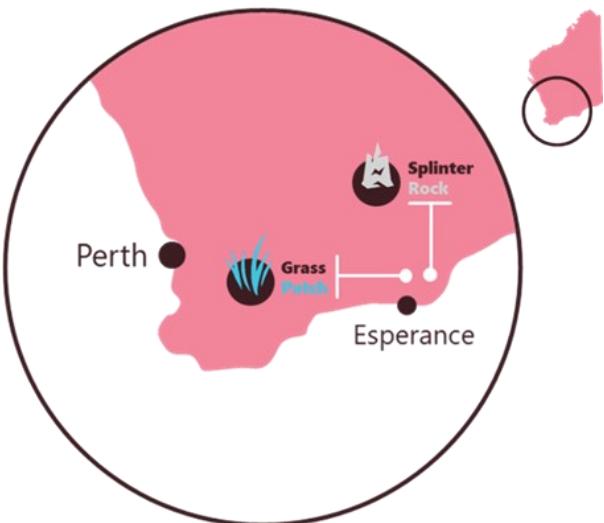

OD6 Metals is an Australian public company pursuing exploration and development opportunities within the critical mineral sector. The Company has successfully identified clay hosted rare earths at its 100% owned Splinter Rock and Grass Patch Projects, which are located in the Esperance-Goldfields region of Western Australia - about 30 to 150km northeast of the major port and town of Esperance.

Drilling and geological analysis at its flagship Splinter Rock has shown widespread, thick, high-grade clay hosted REE deposits that extend over hundreds of square kilometres. Metallurgical testing using hydrochloric acid to leach the rare earths have resulted in positive REE recoveries with optimisation ongoing.

The Company aims to delineate and define economic resources and reserves of REEs, in particular Neodymium (Nd), Praseodymium (Pr), Dysprosium (Dy) and Terbium (Tb) which can be developed into a future revenue generating mine. Clay REE deposits are currently economically extracted in China, which is the dominant world producer of REEs.

REE are becoming increasingly important in the global economy, with uses including advanced electronics and permanent magnets in electric motors. As an example, a neodymium magnet used in a wind turbine or electric vehicle motor is 18 times stronger than a standard ferrite magnet significantly increasing energy use efficiency.

As part of the exploration process the Company has entered into heritage agreements with Esperance Tjaltrjaak Native Title Aboriginal Corporation and the Ngadju Native Title Aboriginal Corporation that serves to both enable exploration & protect important cultural sites on Country.

Corporate Directory

Managing Director	Mr Brett Hazelden
Non-Executive Chairman	Dr Darren Holden
Non-Executive Director	Mr Piers Lewis
Non-Executive Director	Dr Mitch Loan
Financial Controller/ Joint Company Secretary	Mr Troy Cavanagh
Joint Company Secretary	Mr Joel Ives
Exploration Manager	Tim Jones

Note:

TREO (Total Rare Earth Oxide) = La₂O₃ + CeO₂ + Pr₆O₁₁ + Nd₂O₃ + Sm₂O₃ + Eu₂O₃ + Gd₂O₃ + Tb₄O₇ + Dy₂O₃ + Ho₂O₃ + Er₂O₃ + Tm₂O₃ + Yb₂O₃ + Lu₂O₃ + Y₂O₃

Mag REO (Magnet Rare Earth Oxide) = Nd₂O₃ + Pr₆O₁₁ + Tb₄O₇ + Dy₂O₃

HREO (Heavy Rare Earth Oxide) = Gd₂O₃ + Tb₄O₇ + Dy₂O₃ + Ho₂O₃ + Er₂O₃ + Tm₂O₃ + Yb₂O₃ + Lu₂O₃ + Y₂O₃

CREO (Critical Rare Earth Oxide) = Nd₂O₃ + Eu₂O₃ + Tb₄O₇ + Dy₂O₃ + Y₂O₃

% Mag REO = (Mag REO / TREO) * 100

% Heavy REO = (Heavy REO / TREO) * 100

% Critical REO = (Critical REO / TREO) * 100

Drilling Details (Third Phase – 2023)

Note: TREO (Total Rare Earth Oxide) = La₂O₃ + CeO₂ + Pr₆O₁₁ + Nd₂O₃ + Sm₂O₃ + Eu₂O₃ + Gd₂O₃ + Tb₂O₇ + Dy₂O₃ + Ho₂O₃ + Er₂O₃ + Tm₂O₃ + Yb₂O₃ + Lu₂O₃ + Y₂O₃

JORC 2012 – Table1: Splinter Rock

Section 1 Sampling Techniques and Data

(Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<ul style="list-style-type: none"> Geochemical sampling was undertaken by sampling of metre interval samples returned from the cyclone of a conventional aircore drilling rig. Certified reference samples, duplicates and blank samples were inserted into the sample stream such as to represent approximately 5% of the samples submitted to the laboratory for analysis Two composite samples were collected over three metre intervals – the first (the A sample) being submitted for laboratory analysis and the second (the B sample) being retained as a reference. A sample from each metre was collected and stored in a chip tray for logging and x-ray diffraction analysis
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> Air core drilling was completed by hammer and blade industry standard drilling techniques Aircore is considered to be an appropriate drilling technique for saprolite clay Drilling used blade bits of 87mmØ with 3m length drill rods to blade refusal.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<ul style="list-style-type: none"> Air core recoveries were not recorded but are not considered to be materially biased, given the nature of the geology and samples. The assay data will be analysed against control samples and historical assays for any indications of bias The Competent Person considers that due to the nature of the drilling and geology, sample bias is unlikely to result from poor recovery.
<i>Logging</i>	<ul style="list-style-type: none"> <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i> 	<ul style="list-style-type: none"> All chips were logged qualitatively and quantitatively. A sample from each metre was collected and stored in a chip tray for logging Geological logs recorded lithology, colour and weathering.
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is</i> 	<ul style="list-style-type: none"> A composite sample of ~ 3kg for analysis was taken using a scoop from each metre pile to subsample 1 to 1.5kg sample. This was then dispatched to the laboratory. A second composite sample was similarly taken and stored on site as a reference Air core samples were a mix of wet and dry Certified reference samples, duplicates and blank samples were inserted into the sample stream such as to represent approximately 5% of the samples submitted to the laboratory for analysis

Criteria	JORC Code explanation	Commentary																																																
	<p><i>representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></p> <ul style="list-style-type: none"> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 																																																	
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<ul style="list-style-type: none"> • "A Samples" were submitted for chemical analysis using industry standard sample preparation and analytical techniques including: <ul style="list-style-type: none"> • Riffle split all "A samples" to 50:50 bagging one half as a coarse reject for storage • Pulverise the balance of the material via LM-5 • Generate a standard 300g master pulp packet • Bag the balance as a bulk pulp master for storage • Multi-Element Ultra Trace method ME-MS61r for exploration in soils or sediments. 4-Acid digest on 0.25g sample analysed via ICP-MS and ICP-AES. REEs included. 																																																
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> • Certified reference samples, duplicates and blank samples were inserted into the sample stream such as to represent approximately 5% of the samples submitted to the laboratory for analysis • No holes were twinned (duplicated). • Data stored in a database, with auto-validation of logging data, • Multielement results (REE) are converted to stoichiometric oxide (REO) using element-to-stoichiometric conversion factors.

<i>Location of data points</i>	<ul style="list-style-type: none"> • <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> • <i>Specification of the grid system used.</i> • <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> • Rare earth oxide is the industry accepted form for reporting rare earths. The following calculations are used for compiling REO into their reporting and evaluation groups: • TREO (Total Rare Earth Oxide) $= \text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Lu}_2\text{O}_3 + \text{Y}_2\text{O}_3.$ Note that Y₂O₃ is included in the TREO calculation. 																																																
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> • <i>Data spacing for reporting of Exploration Results.</i> • <i>Whether the data spacing and distribution is sufficient to establish the degree of geological</i> 	<ul style="list-style-type: none"> • Drill hole collars were located using a handheld GPS to +/-5m accuracy • Grid system was MGA 94 Zone 51 • Downhole survey was not undertaken, the holes being vertical • No topography control was used, given the relatively flat topography 																																																
	<ul style="list-style-type: none"> • Drilling intervals were approximately 400m centres • Downhole samples were taken on 1m intervals • This drilling indicated excellent continuity, particularly when supported by the results of the 																																																	

Criteria	JORC Code explanation	Commentary
	<p><i>and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p> <ul style="list-style-type: none"> • <i>Whether sample compositing has been applied.</i> 	<p>Tempest Airborne Aeromagnetic Survey, which was used to define basin limits.</p> <ul style="list-style-type: none"> • Tempest Airborne Electromagnetic Survey (AEM), undertaken by Xcalibur Multiphysics • Data collected using the TEMPEST EM system (50Hz) using fixed wing aircraft. • Nominal flight height of 120 m above ground level. • GPS cycle rate of 1 second, accuracy 0.5m • Altimeter accuracy of 0.05m • Flight line spacing 400 to 800m. • Conductivity measurements and sampling interval at approximately 11 to 12 metres along line. • This data when combined with further drilling will be utilised to guide future mineral resource estimation
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> • <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> • <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> • Drillholes were vertical and approximately perpendicular to mineralisation hosted in flat lying clay-beds • This orientation is not considered by the Competent Person to have introduced material sampling bias. • For AEM data: Flight lines are North West- South East: drainage and regolith patterns show a regional slope down from NW to SE, whereas geological structure is dominantly NE-SW. • The thickness of regolith presented in the cross-sections is based on geophysical inversion modelling conducted by the CSIRO. This inversion modelling used Monte Carlo simulation known as RJMCMC regression based on Bodin and Sambridge (2009) https://doi.org/10.1111/j.1365-246X.2009.04226.x & Minsley (2011) https://doi.org/10.1111/j.1365-246X.2011.05165.x with modifying parameters by CSIRO. refer ASX Announcement 5 October 2022 • The RJMCMC method uses a comparison method to estimate the conductivity.
<i>Sample security</i>	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> • Samples were taken and dispatched by road freight direct to the analytical laboratory
<i>Audits or reviews</i>	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> • The Independent Competent Person reviewed the sampling techniques and data collection. The Independent Competent Person has previously completed a site visit during drilling to verify sampling techniques and data collection.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> • <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> • <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> • The Splinter Rock Project is held by Odette Six Pty Ltd which is a 100% owned subsidiary of OD6 Metals Ltd. • Granted exploration Licences include E63/2115, E69/3904, E69/3905, E69/3907, E69/3893, E69/3894. • The ELs predominantly overly vacant crown land with a small portion of freehold agricultural land used for crop and livestock farming to the south. • The Company has Native Title Land Access agreements with Ngadju Native Title Aboriginal Corporate and Esperance Tjaltjraak Native Title Aboriginal Corporation. The tenements are in good standing with no known impediments outside the usual course of exploration licenses.

Criteria	JORC Code explanation	Commentary
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> An Independent Geological Report was completed by Sahara Natural Resources and included in the Company's Prospectus dated 10 May 2022. Historic exploration for REE's was conducted by Salazar Gold Pty Ltd The historical data has been assessed and is considered of good quality
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<ul style="list-style-type: none"> The rare earth mineralisation at the Splinter Rock Project occurs in the weathered profile (in-situ regolith clays) adjacent to and above Booanya Granite of the East Nornalup Zone of the Albany-Fraser Orogen. The Booanya granites are enriched in REEs. Factors such as groundwater dispersion and paleo-weathering environments may mobilise REEs away from the granite sources.
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	<ul style="list-style-type: none"> All drill results are reported to the ASX in line with ASIC requirements A summary of material drill hole information is included in the Drill Hole Data table included above No material has been excluded. Some results occur outside the mineralised area of interest and have been excluded as not being of material interest. Internal waste results have been included in the mineralised intercepts. Mineralised intersections have been publicly reported by OD6 in accordance with the JORC Code and ASX Listing Rules and are not repeated here. The Competent Person observes consistent broad intersections of REEs and is satisfied that the drilling information supports this interpretation.
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<ul style="list-style-type: none"> No cutting of grades has been engaged in Data has been aggregated according to downhole intercept length above the cut-off grade and internal sub-grade material has been included. A lower cut-off grade of 300ppm TREO has been applied. OD6 considers this to be an appropriate cut-off grade for exploration data in a clay-hosted REE project A 1,000ppm cut off grade has been applied to the Mineral Resource Multielement results (REE) are converted to stoichiometric oxide (REO) using element-to-stoichiometric conversion factors. These stoichiometric conversion factors are stated in the 'verification of sampling and assaying' table above and can be referenced in appropriate publicly available technical data.
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> Drillholes drilled vertical and orthogonal to generally flat to shallow dipping clay mineralisation. Drilled width is approximately true width.
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> Drilling results are presented in plan with significant intercepts and max down hole grade.
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high</i> 	<ul style="list-style-type: none"> All drillhole results have been reported including those drill holes where no significant intersection was recorded.

Criteria	JORC Code explanation	Commentary
	<i>grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	<ul style="list-style-type: none"> Electromagnetic data processing presented in this release is across all tenure at Splinter Rock. Further work on the remainder of the project is underway
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> All material data available is reported. There have been various photogrammetric and geophysical surveys at Splinter Rock at various times that have contributed to understanding of the geology of the deposit. The Competent Person considers these to have been undertaken in an appropriate manner
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> Mineralisation is open in multiple directions. Further work will include additional air core drilling, core drilling (e.g sonic or push-tube drilling), mineralogy, metallurgical test work and study work. Further work will include additional air core drilling, core drilling (e.g sonic or push-tube drilling), mineralogy, metallurgical testwork and study work.
