

## ASX ANNOUNCEMENT

18<sup>th</sup> December 2023

# Soil Sampling Highlights Broad Target West of Junior Mine, Doherty and Junior Mine Extensions

**Follow-up soil sampling results from the Doherty Manganese Project in NSW have defined broad, coherent manganese mineralisation and a large target for ongoing soil sampling and future geophysical testing.**

## HIGHLIGHTS

- Follow-up soil sampling has been completed over the Doherty Manganese Project in NSW which historically produced battery and metallurgical grade manganese.
- Rock chip samples recently assayed from the Doherty Mine extension returned grades up to 59.29% Mn and from the Junior Mine extension up to 57.14% Mn, (ASX Announcement 8 December 2023).
- Soil anomalism to the west of the Junior Mine highlight a broad and elongate exploration target.
- Infill and extensional soil sampling programs to further define Junior and Doherty Mine extensions being designed for January.

Great Dirt Resources Ltd (“Great Dirt” or “the Company”) is pleased to announce recently returned assays (ALS, Brisbane) for the second tranche of soil samples from the 100% owned Doherty Manganese Project in NSW within EL 9527.

**Great Dirt’s Managing Director, Marty Helean commented,**

*“We continue to see enormous potential outside of the areas of known mineralisation, especially to the west of the Junior Mine. Work will continue to further extend sampling areas and infill areas that have shown significant manganese mineralisation. We look forward to updating the market as results come to hand.”*

This soil sampling program was conducted following the first program of rock chip and soil sampling which defined extensions to favourable manganese-bearing host rocks. The sampling was conducted within EL 9527 where rocks of the Devonian aged Woolomin Group form part of the accretionary complex forming the central part of the Southern New England Orogen.

This program was completed over a five-day period where 581 samples were taken. The samples were analysed at ALS in Brisbane.

The soil sampling program comprised:

- Four lines of soils were completed north of Doherty, these lines were between 1km and 1.3km in length, with samples being taken every 50m along the line.
- South of Doherty a further three lines were completed with lengths between 1.6 and 2.1km in length, with samples being taken every 50m along the line.
- Six soil lines were completed to the west and north of the Junior Mine, here the lines were between 345m and 2.25km in length with samples being taken every 50m.
- South and west of the Junior Mine a further six lines were completed. These lines were between 648m and 1.3km long with samples being taken every 50m.
- Finally, three lines of soil were completed near and over the boundary of the Bundarra granite in the very north of the tenure and the historical manganese mineral occurrence at Daileys Deposit.

At the Junior Mine and surrounds soil sampling has returned broad anomalous which is not yet fully resolved and further extension and infill sampling will be needed to completely define this target. These results lend further weight to Great Dirt's belief that larger district scale targets exist in the area, likely formed as primary exhalative stratiform manganese oxide deposits.

Anomalies, at the Doherty Mine and surrounds, clearly define an extension to the south of the mine area. Further lines are planned to infill the areas directly to the north of the mine area to better refine the extension to the mine stratigraphy and ore zones.

These potential larger district scale targets remain untested by modern exploration and follow-up work being planned for January is designed to further test this. Infill sampling will also be used to test for the mine extensions at Doherty and Junior.

### **Ongoing Work**

Systematic gridded soil geochemistry that is being planned for January will further map the manganese mineralisation highlighting strike extensions away from historical mines and areas of known mineralisation. Infill soil sampling of current anomalous and more reconnaissance geological mapping and rock sampling will also be completed.

Thomson Airborne Pty Ltd has completed a magnetic and radiometric survey over the Doherty project and surrounds. The survey raw data will soon be received and will then be processed, and targets generated from this work. This survey should enable the modelling of stratigraphic units and any structural controls related to their presentation.

## About Great Dirt Resources LTD

Great Dirt's Doherty and Basin Projects are contained within EL 9527, located near the Barraba township, in northern NSW. These projects are prospective for high-grade manganese, with both projects having produced metallurgical and battery grade manganese historically. The Doherty Project comprises the old Doherty and Junior Mines, plus other workings and occurrences of manganese. The Basin Project contains several smaller manganese workings.

From 1941, for two decades, mines of the Doherty Project produced around 9,000 tonnes of battery and metallurgical grade manganese, both from opencut and underground operations. The battery grade ore was delivered to Eveready in Sydney for use in dry cell batteries, the metallurgical grade ore was purchased by BHP for use in steel production.

Great Dirt believes that historical work, while having discovered manganese, is unlikely to have located all sources in the area. Floater, large rock fragments in the soil profile, of high-grade manganese ore reported outside known mine areas are a direct indication of unidentified manganese mineralisation. Additionally, notes on the mineral occurrences of the area refer to extensions and deposits along strike that were not mined.

A program of modern, systematic, geochemical and geophysical surveys will test known targets and their extents and could locate previously unrecognised blind deposits. Subsurface geophysical methods and drilling is likely to yield further targets that could be developed into projects to produce metallurgical and battery grade manganese.

## Competent Person's Statement

Information in this announcement that relates to exploration results is based on and fairly represents information and supporting documentation prepared and compiled by Mr Michael Leu, who is a Member of the Australian Institute of Geoscientists and a Member of the Australasian Institute of Mining and Metallurgy. Mr Leu is the geological consultant for Great Dirt Resources Limited. Mr Michael Leu has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person, as defined in the 2012 Edition of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves. Mr Michael Leu consents to the inclusion in the announcement of the matters based on this information in the form and context in which it appears.

## No New Information

Except where explicitly stated, this announcement contains references to prior exploration results, all of which have been cross-referenced to previous market announcements made by the Company. The Company confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements.

## Forward Looking Statement

This report contains forward looking statements concerning the projects owned by Great Dirt Resources LTD. If applicable, statements concerning mining reserves and resources may also be deemed to be forward looking statements in that they involve estimates based on specific assumptions. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward looking statements are

based on management's beliefs, opinions and estimates as of the dates the forward looking statements are made and no obligation is assumed to update forward looking statements if these beliefs, opinions, and estimates should change or to reflect other future developments.

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <li><i>Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<p><b>SOIL SAMPLES</b></p> <ul style="list-style-type: none"> <li>A total of 581 soil samples were collected, 50 metre sample spacings, along east-west sampling lines approx. 250m apart.</li> <li>Sample were collected at an average of 10cm below surface. Average soil sample size collected was about 500grams.</li> <li>Field duplicates were not collected.</li> <li>To ensure industry standards, soil samples were dispatched to ALS Minerals (Brisbane) where they were prepared by method: PREP-41: Dry at &lt;60°C, sieve sample to -180 micron (80 mesh). Retain both fractions.</li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i></li> </ul>	<ul style="list-style-type: none"> <li>Not applicable to soil sampling program</li> </ul>
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> </ul>	<ul style="list-style-type: none"> <li>Not applicable to soil sampling program</li> <li>N/A</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<i>Logging</i>	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i></li> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>Not applicable to soil sampling program</li> </ul>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul>	<p><b>SOIL SAMPLES</b></p> <ul style="list-style-type: none"> <li>In the field approximately 0.5kg of bulk unsieved sample was collected into a sealed into plastic bag.</li> <li>If the site location was deemed to have possible transported material, either the soil sample was not taken, or taken from a different site</li> <li>To ensure industry best practice the sample preparation technique was undertaken by accredited laboratory ALS as follows: Soil Samples PREP-41. AuME-TL44 (50g sample). Dry at &lt;60°C/140°F, sieve sample to -180 micron (80 mesh). Retain both fractions.</li> <li>The sample sizes are standard industry practice sample sizes collected under standard industry conditions and by standard methods that are considered appropriate for the medium being sampled, the laboratory techniques employed and the type and style of mineralisation which might be encountered at this project.</li> </ul>

<i>Geology</i>	<ul style="list-style-type: none"> <li>• <i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Volcanogenic-exhalative stratiform manganese deposits</li> <li>• 1) The known previously exploited surficial supergene manganese oxides were very high-grade (46-74% MnO<sub>2</sub>) and relatively discrete deposits that occur where either structural, surficial or hydrothermal processes have concentrated underlying mineralisation. These deposits were mined by artisanal miners because they were outcropping, deposits located between areas of outcrop or concealed by transported cover would have gone unrecognised. These blind deposits would contain similar high-grade mineralisation to that mined.</li> <li>• The proposed new exploration concept is these surficial deposits are not an expression of an underlying manganese silicate deposit but are actually formed from a primary exhalative stratiform manganese oxide deposit. This dramatically increases the size of the targets to district scale deposits. Historical rudimentary exploration would have been uninterested in manganese mineralisation below 45% as no market existed for mineralisation sub-metallurgical grade with no beneficiation available.</li> <li>• Evidence supporting this exploration concept is:</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <li>• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:           <ul style="list-style-type: none"> <li>○ easting and northing of the drill hole collar</li> <li>○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>○ dip and azimuth of the hole</li> <li>○ down hole length and interception depth</li> <li>○ hole length.</li> </ul> </li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<p>Surficial high-grade supergene manganese oxide deposits are likely present regionally, outcropping, some identified, and probably also blind deposits, remaining undiscovered. EL9527 is prospective for these deposits, evidence is found in the numerous mineral occurrences highlight existing resources and extensions to historical mines. Multi-element assays of samples collected by field team and analysed by ALS confirm the high-grade ore has clear chemical affinities with submarine volcanic-sedimentary exhalative Mn deposits, especially the Mn/Fe ratio and anomalous concentrations of Ba, Sr, Co, Cu, As and W, signature characteristics of deep marine fumarolic modern day manganese deposits (Ashley 1986). Ashley states this strongly implies a submarine volcanic exhalative environment of deposition. He notes the high Mn/Fe accords with hydrothermal exhalative Mn deposits at submarine spreading ridges and in ophiolite terrains with exhalative Mn deposits generally (e.g., Roy 1981)</p> <ul style="list-style-type: none"> <li>• N/A, no drilling undertaken or reported.</li> <li>• N/A</li> </ul>
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical</li> </ul>	<ul style="list-style-type: none"> <li>• No weighting of averaging techniques has been utilized.</li> <li>• No aggregations are reported.</li> <li>• No metal equivalents were used or calculated.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p><i>examples of such aggregations should be shown in detail.</i></p> <ul style="list-style-type: none"> <li><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></li> </ul>	
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <li><i>These relationships are particularly important in the reporting of Exploration Results.</i></li> <li><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></li> <li><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></li> </ul>	<ul style="list-style-type: none"> <li>N/A, no drilling undertaken or reported</li> <li>N/A</li> <li>N/A</li> </ul>
<i>Diagrams</i>	<ul style="list-style-type: none"> <li><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></li> </ul>	<ul style="list-style-type: none"> <li>Pertinent maps for this stage of Project are included in the release.</li> <li>Coordinates in MGA94 Z55.</li> </ul>
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <li><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></li> </ul>	<ul style="list-style-type: none"> <li>Results for all soil samples are reported in the release.</li> <li>All results described in this announcement have been reported.</li> </ul>
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <li><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></li> </ul>	<ul style="list-style-type: none"> <li>All substantive data has been disclosed.</li> </ul>
<i>Further work</i>	<ul style="list-style-type: none"> <li><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></li> <li><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></li> </ul>	<ul style="list-style-type: none"> <li>Field crews have been mobilised to site to commence orientation soil geochemical sampling and rock chip sampling of strike extents of known deposits and mineral occurrences.</li> <li>Orientation geochemical surveys are carried out prior to more systematic sampling over areas of known mineralisation. The purpose of this survey is to determine what the background values of elements of interest are in non-</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>mineralised areas, helping to define thresholds which determine what constitutes an anomalous response. The surveys will enable Great Dirt to determine the nature and extent of dispersion patterns related to manganese mineralisation and the distribution and behaviour of elements of interest against background.</p> <ul style="list-style-type: none"> <li>The systematic gridded soil geochemistry that follows will then map the dispersion of manganese in the soil profile above background, highlighting strike extensions away from historical mines and areas of known mineralisation.</li> <li>Further infill soil sampling and more reconnaissance geology mapping and rock sampling will be done on new anomalies defined by the work reported herein.</li> <li>Thomson Aviation Pty Ltd has completed a magnetic and radiometric survey over the Doherty project and surrounds. This survey should enable the modelling of stratigraphic units and any structural controls related to their presentation.</li> <li>Drilling programs will be designed following evaluation of the data discussed above.</li> </ul>
