MAIDEN GOLD RESOURCE ESTIMATE

INFINIT

MINING

Highlights

- 60,300 ounce inferred Mineral Resource Estimate
- IMI has completed a Gold Exploration Target Estimate
- On track to monetise Goldfields Assets in Q1 2024

Infinity Mining Limited (ASX: IMI) ("Infinity" or the "Company") is pleased to announce its first resource estimate in conjunction with a highly prospective exploration target estimate. The Central Goldfields Project comprises 10 mining and prospecting licenses in the prolific gold district of Leonora in the Eastern Goldfields region of Western Australia.

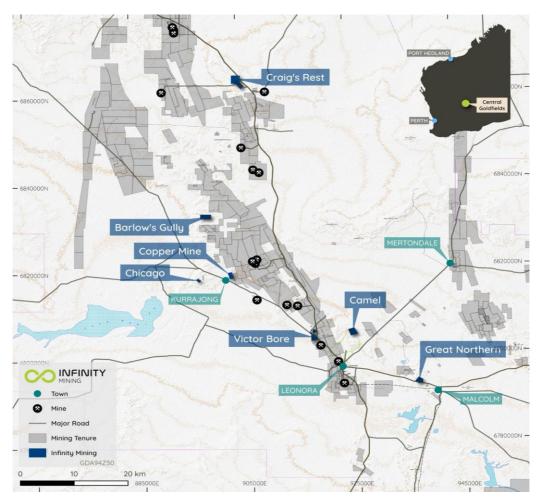

Figure 1 – Central Goldfields Project

The inferred (see Figure 2) **JORC 2012 Mineral Resource Estimate (MRE)** has been compiled from <u>results</u>¹ for part of the project.

Classification	Cut-off	Tonnes	Au (g/t)	Ounces
Inferred	0.5	1,330,000	1.41	60,300

Figure 2 – Gold Resource Estimate

INFINITY

MINING

To assist with planning and provide an understanding of potential gold mineralisation across the Central Goldfields Project, IMI commissioned an **Exploration Target Estimate** (see Figure 3). The results are extremely encouraging with up to **592,000 ounces** @ **3.7** g/t potentially discoverable across the project (see Figure 3).

		Min Range			Max Range		
	Million Tonnes	Au (g/t)	Thousand Ounces	Million Tonnes	Au (g/t)	Thousand Ounces	
Surface Extensions	1.35	1.2	49.5	4.07	2.1	264.0	
Below current resources	0.38	5.7	67.1	1.08	9.8	328.0	
Total	1.73	2.2	116.6	5.15	3.7	592.0	

Figure 3 – Exploration Target Estimate (see Appendix 1)

NEXT STEPS

IMI continues to refocus and plan high value generative steps for lithium discoveries in the world class <u>Pilbara</u> <u>Lithium Province</u>. In parallel, the company is actively undertaking negotiations with third parties in relation to **sale or partnerships of non-core assets** including the Central Goldfields Project. Any resultant transactions may provide the Company with further funds with which **to expedite lithium related activities**.

For further information please contact:

Joe Phillips Executive Chairman +61 7 3221 1796 communications@infinitymining.com.au

¹ RC DRILLING DELIVERS ENCOURAGING GOLD RESULTS FROM CENTRAL GOLDFIELDS, WA

Company Profile

Infinity Mining Limited holds 100% interest in over 700 km² of tenements in the East Pilbara as well as 22 km² in the Central Goldfields regions of Western Australia. These tenements are located in highly prospective Lithium, Nickel, Copper and Gold terranes. The Company's business strategy is an increasing focus on lithium exploration on its highly prospective Pilbara tenements.

Caution Regarding Forward Looking Statements

Certain of the statements made and information contained in this press release may constitute forward-looking information and forward-looking statements (collectively, "forward-looking statements") within the meaning of applicable securities laws. All statements herein, other than statements of historical fact, that address activities, events or developments that the Company believes, expects or anticipates will or may occur in the future, including but not limited to statements regarding exploration results and Mineral Resource estimates or the eventual mining of any of the projects, are forwardlooking statements. The forward-looking statements in this press release reflect the current expectations, assumptions or beliefs of the Company based upon information currently available to the Company. Although the Company believes the expectations expressed in such forward-looking statements are based on reasonable assumptions, such statements are not guarantees of future performance and no assurance can be given that these expectations will prove to be correct as actual results or developments may differ materially from those projected in the forward-looking statements. Factors that could cause actual results to differ materially from those in forward-looking statements include but are not limited to: unforeseen technology changes that results in a reduction in copper, nickel or gold demand or substitution by other metals or materials; the discovery of new large low cost deposits of copper, nickel or gold; the general level of global economic activity; failure to proceed with exploration programmes or determination of Mineral resources; inability to demonstrate economic viability of Mineral Resources; and failure to obtain mining approvals. Readers are cautioned not to place undue reliance on forwardlooking statements due to the inherent uncertainty thereof. Such statements relate to future events and expectations and, as such, involve known and unknown risks and uncertainties. The forward-looking statements contained in this press release are made as of the date of this press release and except as may otherwise be required pursuant to applicable laws, the Company does not assume any obligation to update or revise these forward-looking statements, whether as a result of new information, future events or otherwise.

Competent Persons Statement

The information contained in this report that relates to the Exploration Results is based on information compiled by Mr Andrew Hawker, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Hawker is a Geological Consultant for Infinity Mining and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he has undertaken to qualify as Competent Person as defined in the 2012 Edition of the Australasian JORC Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Hawker consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

APPENDIX 1 - EXPLORATION TARGET ESTIMATE BASIS

The current defined resources are well under explored and incomplete. The grass-roots data comprising geophysics, geochemistry and satellite imagery show a larger story that can define additional mineralisation and sufficient for an Exploration Target Estimate. Satellite imagery is especially useful in the ability to show historical surface working, geological outcrops and cross-structures normally defined by rivers and creeks.

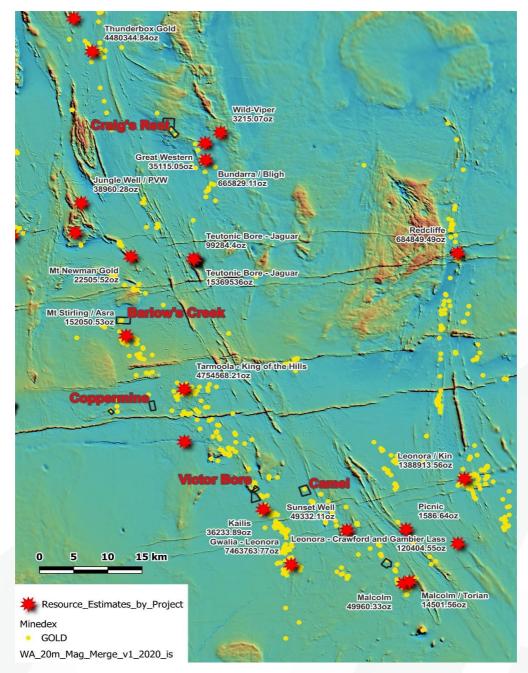

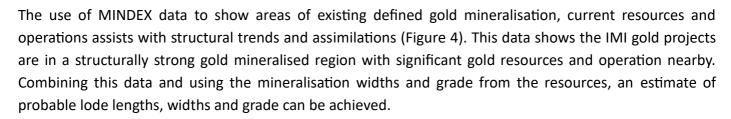

Figure 4 - Regional magnetics showing the IMI goldfields projects, nearby resources and gold discoveries.

The process in determining the Exploration Target Estimate may be slightly different for each prospect area and will be outlined below. The Exploration Target Estimate below existing resource evaluations will be slightly different to those along strike due to variations in probable mining differences and increasing grade at depth.

Craig's Rest

INFINIT

MINING

Craigs Rest currently has 3 resource trends defined in the above resource evaluation of Garden Well, Katalina and Craigs. None of the resource mineralisation trends are complete due to incomplete drilling programs. Figure 4 shows the mineralisation areas in the Craigs Rest Prospect with structures and mineralisation lengths.

Garden well is complete in its current form due to cross-faulting truncating the resource at both ends. The satellite imagery shows the truncations defined by creeks with continuing mineralisation defined by outcrops and historical workings. Surface geochemistry has defined a weak trend of gold mineralisation which correlates with satellite and magnetic structures as well as the general trend of regional mineralisation, north-west. Current drilling within Garden Well show consistency as the mineralisation goes deeper with significant grades and widths of greater than 3m @ 6g/t Au. The additional mineralisation trends have a combined trike length of 829m.

To the north of Garden Well is an area defined by past consulting geologists as being prospective for gold mineralisation. The geochemistry is showing a trend of high-grade gold grades and supporting structures from satellite imagery with truncations at either end by crossing creeks. This zone of mineralisation is sub-parallel to Garden Well and is worthy of detailed follow-up drilling. The defined trend of mineralisation has a strike length of 636m. There appears to be additional mineralisation trends in the area but lack supporting information to be considered here.

Katalina is the smallest of the resource mineralisation trends so far but has significant high-grade widths of over 2m @ 26.6g/t Au at 50m below surface and showing a large increase in grade at depth. The current resource does have the potential for an underground resource. Current drilling is not truncated, and surface definitions, magnetics and geochemistry define considerable mineralisation trends. The combined mineralisation trends defined is 835m.

Craigs currently has 6 mineralised trends in the resource with only 2 of these trends showing extensions to the limits of the current drilling. These 2 main trends are faulted in the middle. Geochemistry, magnetics and satellite mapping has defined extensions and additional mineralisation trends with combined trike length of 811m.

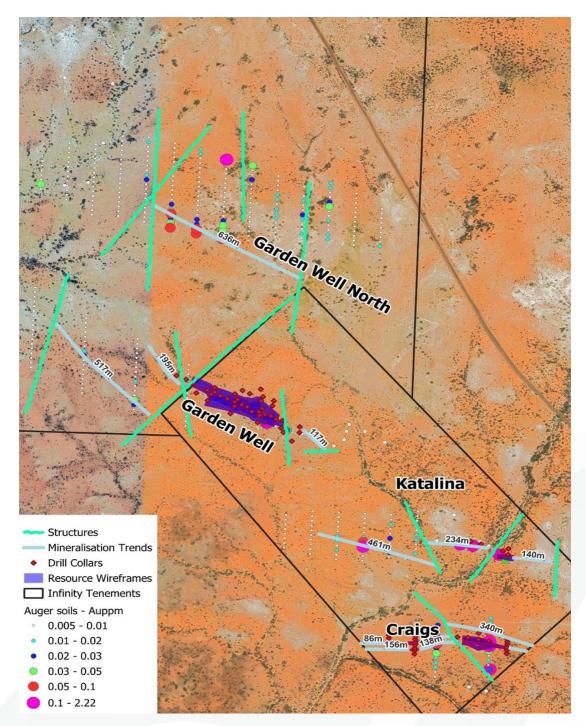

Figure 5 - Craig's Rest Exploration Target Estimate mineralised trends and structures.

The Craig's Rest Exploration Target Estimate is based on the following criteria:

• Near surface Mineralisation extensions:

INFINIT

MINING

- Total Strike Length: 3,111m
- $\circ~$ Average width: 2m to 6m (based on the minimum and maximum width from the current resource interpretations)
- Mineralisation depth: 100m
- Average density: 2.0t/m³
- Grade range: 1.1g/t Au to 2.0g/t Au (based on the average grade ranges of the current resource interpretations).
- Tonnage Range: 1.244mt to 3.733mt for 44koz to 240koz
- Mineralisation extensions under current resources:
 - Total Strike Length: 1491m
 - Average width: 2m to 6m (based on the minimum and maximum width from drill intercepts at depth)
 - o Mineralisation depth: 40m below current resource
 - Average density: 2.60t/m³
 - Grade range: 6.0g/t Au to 10.0g/t Au (based on the average grade ranges of drill intercepts at depth).
 - Tonnage Range: 310kt to 930kt for 60koz to 300koz

Craig's Rest Exploration Target Estimate is:

Exploration Target		Min Range		Max Range		
Estimate	Million Tonnes	Au (g/t)	Thousand Ounces	Million Tonnes	Au (g/t)	Thousand Ounces
Surface Extensions	1.24	1.1	44	3.73	2.0	240
Below current resources	0.31	6.0	60.0	0.93	10.0	300
Total	1.55	2.2	104	4.66	3.7	540

Victor Bore

The current Victor Bore resource has potential along strike but is limited by tenement boundaries. Drilling outside of the resource along with surface geochemistry and satellite imagery of surface disturbances, show a potential sub-parallel structure containing gold mineralisation (Figure 6). There is further historical surface working but no supporting geochemistry or drilling to define any additional potential structures for this exercise. Ongoing surface geochemistry will aid in the definition and should be conducted as part of future exploration programming.

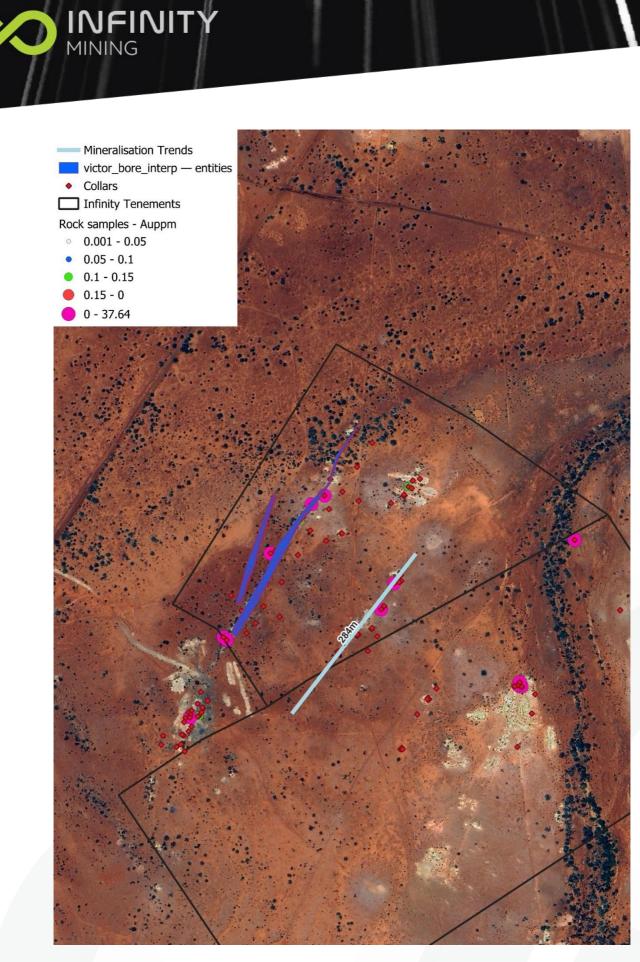

Figure 6 - Victor Bore resource and additional mineralisation trend.

The Victor Bore Exploration Target Estimate is based on the following criteria:

- Near surface Mineralisation extensions:
 - o Total Strike Length: 284m
 - $\circ~$ Average width: 2m to 6m (based on the minimum and maximum width from the current resource interpretations)
 - Mineralisation depth: 100m
 - Average density: 2.0t/m³
 - Grade range: 1.5g/t Au to 2.2g/t Au (based on the resource cut-off using 0.3g/t Au and 1.0g/t Au ranges).
 - Tonnage Range: 114kt to 340kt for 5.5koz to 24koz
 - Mineralisation extensions under current resources:
 - o Total Strike Length: 354m
 - Average width: 2m to 4m (based on the minimum and maximum width from drill intercepts at depth)
 - o Mineralisation depth: 40m below current resource
 - Average density: 2.60t/m³
 - Grade range: 3.0g/t Au to 6.0g/t Au (based on the average grade ranges of drill intercepts at depth).
 - Tonnage Range: 74kt to 147kt for 7.1koz to 28koz

Victor Bore Exploration Target Estimate is:

Exploration Target		Min Range		Max Range		
Estimate	Million Tonnes	Au (g/t)	Thousand Ounces	Million Tonnes	Au (g/t)	Thousand Ounces
Surface Extensions	0.11	1.5	5.5	0.34	2.2	24.0
Below current resources	0.07	3.0	7.1	0.15	6.0	28.0
Total	0.18	2.2	12.6	0.49	3.4	52.0

<u>NOTE RE EXPLORATION TARGET ESTIMATE</u>: The potential quantity and grade of this exploration target is conceptual in nature, there is currently insufficient exploration completed to support a mineral resource of this size and it is uncertain whether continued exploration will result in the estimation of a JORC resource. The Exploration Target has been prepared in accordance with the JORC Code (2012).

APPENDIX 2 - JORC Code, 2012 Edition - Table 1

Section 1 - Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	 Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	 A total of 37 x reverse circulation (RC) drill holes were completed by Infinity Mining Ltd in the Central Goldfields of WA, in late January to early March 2023. Holes were drilled to depths ranging from 78 to 132 m Holes were drilled at various azimuths, with dips largely at -60 degrees. Reverse circulation drilling was used to obtain 1 m samples from the rig-mounted cyclone, from which a 2-3 kg representative split sample was collected into calico sample bags via a cone splitter. A total of 2286 RC drill chip samples were collected during the program, including one (1) metre RC samples within logged zones of interest, plus four (4) metre composite samples outside those logged zones of interest. Samples were dispatched to Jinning Laboratory in Perth for analysis. The calico bag samples were then dried, crushed and pulverised. Gold was analysed by 50g charge for fire assay with AAS finish. The samples were also assayed for multi-element analysis by ICP-OES, for a 33-element suite (results pending).
Drilling techniques	• Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	 RC drilling was conducted by iDrilling Australia, Drilling Contractors using an Hydco 350 RC rig using a 5.5-inch face sampling hammer bit. PVC casing was used at each hole to protect the collar. Drilling methods and equipment were to best industry standard.
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	 Recovery can be monitored by observing the consistency of drill chip amounts collected for each 1 m sample. No significant loss of recovery was observed in any 1 m intervals during the program. Typical recoveries for this RC program are estimated to be in excess of 80%. Samples were largely dry, with only a few samples being moist.

Criteria	JORC Code explanation	Commentary
		 No significant groundwater was encountered that would impact recovery.
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	 Geological logs were completed for all drill holes by an experienced geologist. The lithology, weathering, oxidation, colour, grainsize, texture, alteration, veining, structure and mineralisation were recorded in digital spreadsheets at the time of drilling. Logs are largely qualitative in nature using company logging codes. Logging of sulphide mineralisation and quartz veining was quantitative. All intervals drilled were logged.
Sub-sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all subsampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	 RC drilling was used to obtain 1 m split samples, from the rig-mounted cyclone, from which a 2-3 kg split sample was collected into pre-numbered calico bags using a cone splitter. A total of 2286 RC drill chip samples were collected during the program, including one (1) metre RC samples within logged zones of interest containing quartz veining and mineralisation/alteration, plus four (4) metre composite samples outside those logged zones of interest. No drilled intervals were left unsampled. Back-up samples for every 1 m drill interval were also collected and securely stored. The 4 m composite samples were collected using a manual sample spear and sent to the laboratory for analysis. If any assays from the 4m composite samples contain anomalous assay results, these will be re-assayed at 1 m intervals. All samples were transported to Jinning Laboratory in Perth for analysis. Samples were dried, crushed and pulverized to nominal 85% passing 75 microns, prior to assaying.
Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory 	 All laboratory assaying was completed by the Jinning Testing and Inspection Laboratory, in Perth, WA. RC drill samples submitted to the Lab were dried, crushed and pulverised to produce a 50 g charge for fire assay for gold, with an AAS finish (code FA50A). This analytical method has a detection limit of 0.01 g/t Au. Samples were also analysed by Mixed Acid Digest ICP-OES for a 33-element suite (results pending). Infinity QAQC protocols were implemented.

C

Criteria	JORC Code explanation	Commentary
	checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	 QAQC samples were inserted into the sample sequence, with standards, blanks and duplicates in the ratio of approximately 1:25. All QAQC samples will be evaluated when assays are received. Internal laboratory repeats and QAQC samples were also reported by the Laboratory. For the assays received to date, all QAQC samples fall within expected, standard tolerance limits.
Verification of sampling and assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	 All drill hole data was collected electronically and checked by an experienced geologist. Digital drill data has been safely stored on Infinity's server. No twinned holes were drilled. No QAQC issues were identified in the results recovered to date.
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 All collar locations were initially recorded with a handheld Garmin 65 GPS with a +/- 3m to 5m accuracy. All collars were then surveyed using an RTK Differential GPS with a 40 mm level of accuracy. GDA94 datum and MGA zone 51 was used. A table of drill hole collar details is included in the body of the report for all 37 drill holes completed. Maps showing the drill hole locations for several key projects where significant intercepts were reported are included in the body of the report.
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	 Drill holes were designed to test a variety of geochemical, geophysical and structural targets defined in 2022, for Archaean shear-hosted gold systems and Volcanogenic Massive Sulphide (VMS) base-metal deposits. Drill holes were generally designed to intersect the observed mineralisation present at surface associated with old mine workings, at various depths below surface, to test the depth and strike extents of the mineralisation. All drill holes were designed to drill across strike at roughly 90 degrees to the strike of the main structure of interest. The drill spacing is variable.
Orientation of data in relation to geological	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	 Holes were generally angled to intersect the interpreted depth extension of the target structures, at the optimal orientation No sampling bias due to drilling orientation is known

Criteria **JORC Code explanation** Commentary structure If the relationship between the drilling orientation at this time. • and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. Sample The measures taken to ensure sample security. The drill samples were placed in bulk bags and • • transported by Infinity Mining staff to Kalgoorlie. A security local transport company was used to deliver the samples to Jinning Laboratory in Perth. • All samples were checked on arrival by the Laboratory. Audits or The results of any audits or reviews of sampling No audits or reviews of sampling techniques and ٠ ٠ reviews techniques and data. data were undertaken.

Section 2 - Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 The Central Goldfields Projects is located in the Leonora District of WA. The following tenements are the subject of this report. Victor Bore (P37/8376, M37/1349). Great Northern (P37/8310, M37/1360) Barlow's Gully (P37/8278, M37/1359) Coppermine (P37/9162) Camel (P37/8325) Craig's Rest (P37/8468, E37/1442) Chicago (M37/983) All tenements are held by Infinity Mining Limited and are in good standing.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	 Numerous old shallow workings and prospecting pits occur at most of the projects in the Central Goldfields. The age of historical mining is not well constrained. The historical exploration work has been limited in the Central Goldfields tenements but includes geochemical sampling and drilling by a range of companies over the past 4 decades including the following. Victor Bore – GME Resources. Great Northern – Melita Mining (1987), North Limited (1990s). Barlow's Gully – No previous exploration records. Coppermine – Kulim Limited (1984), Orion Resources (1995), Pacmin (1998), Jupiter Mines (2007), Bligh Resources (2010). Camel – Sons of Gwalia (1986), Endevour

Criteria	JORC Code explanation	Commentary
		 Resources (1989), St Barbara Mines (1993), Goldfields Exploration (1993), Teck Cominco (2005), Medusa (2006). Craig's Rest – Katalina Mining (1987), Aztec Exploration (1990), Mount Edon (1992), Tarmoola Australia (1997). Chicago - Jupiter Mines (2008), Bligh Resources (2014). Details of the historical exploration are documented within the Infinity Prospectus dated October 2021 and previous ASX Announcements released by Infinity.
Geology	 Deposit type, geological setting and style of mineralisation. 	 The Central Goldfields tenements are located in the Leonora District of the Central Goldfields. The projects lie within greenstone belts associated with several NW-trending faults such as the Ursus Fault Zone. The tenements in the same area as a number of significant gold deposits such as King of the Hills and Kailis. The greenstones are also intruded by younger Archean granites. The projects are prospective for orogenic Archaean shear-hosted gold systems and Volcanogenic Massive Sulphide (VMS) base-metal deposits.
Drill hole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<u>See IMI ASX release 1st June 2023</u>
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical 	 All gold intercepts quoted within the Table in the body of the report are weighted averages Gold (g/t), using a cut-off of 0.1 g/t Au. Where gold repeats were recorded, the first sample was used to calculate the weighted average grade. No assays below the cut-off (internal "waste") were included in the intercepts. Additional multi-element assays are pending.

Ø

Criteria **JORC Code explanation** Commentary examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. Relationship These relationships are particularly important in The gold-bearing intervals quoted in the report are • ٠ the reporting of Exploration Results. close to being perpendicular but are not true widths. between *If the geometry of the mineralisation with respect* mineralisation to the drill hole angle is known, its nature should widths and be reported. intercept If it is not known and only the down hole lengths lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). Diagrams Appropriate maps and sections (with scales) and See IMI ASX release 1st June 2023 • tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. Balanced Where comprehensive reporting of all Exploration The results provide sufficient data density and Results is not practicable, representative reporting structure to report an inferred resource within 2 reporting of both low and high grades and/or widths should prospect areas: Craigs Nest and Victory Bore be practiced to avoid misleading reporting of Exploration Results. MINING

See IMI ASX release 1st June 2023

Section 3 - Estimation and Reporting of Mineral Resources

Criteria	JORC Code explanation	Commentary
Database integrity	 Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. 	 Data was created by the competent person using Surpac software into an Access database. Files used are original from field geologists, surveyors and laboratory csv files. Data was checked for duplicates and accuracy between hole_ID's for all files being collar, survey, assay and geology. Any errors were checked, fixed and re-imported
Site visits	 Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	 The competent person has not visited these tenements directly but has over 30 years' experience in the region with resource evaluations for nearby companies. A site visit for this inferred resource was not required due to the level of experience by the field geological personnel conducting the work, the level of detailed reporting of all work completed and experience level of the competent person in the region.
Geological interpretation	 Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. 	 Geological interpretations were conducted by IMI senior geological consultants combining surface mapping of exposed historical workings and outcropping host lithologies. The IMI interpretations were used as a basis for the resource evaluation and modified slightly to correlate with mineralisation background.
Dimensions	The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.	 3 resource models were created combining 4 prospect areas with the following mineralisation dimensions: Garden Well, Katalina, Craigs and Victor Bore Garden well dimensions: 400m long x 166m wide x 150m deep on an orientation of 290 degrees. Katalina dimensions: 70m long x 84m wide x 80m deep on an orientation of 90 degrees (east-west). Craigs dimensions: 480m long x 58m wide by 77m deep on an orientation of 90 degrees (east – west). Victor Bore orientation: 350m long x 60m wide x 110m deep on an orientation of 028 degrees
Estimation and modelling techniques	• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen	 The resource was conducted as an inferred resource due to insufficient data to accurately define structures and grade trends. Interpolation method used was inverse distance squared to apply a greater weighting to the local samples. Statistics were conducted to ensure outlier samples

Criteria **JORC Code explanation** Commentary did not influence the result. Only the Craigs Rest include a description of computer software and parameters used. models comprising the deposits of Garden Well, Katalina and Craigs had a high-grade cut applied of The availability of check estimates, previous 15g/t Au. The outlier assays were 4 samples around estimates and/or mine production records 55g/t Au. Garden Well:15m x 2m x 5m (vertical) based on • • Any assumptions about correlation between drilling pattern of 30m spacing and narrow variables. interpretated lodes • Description of how the geological Craigs: 20m x 2m x 5m based on drilling pattern interpretation was used to control the of 40m and narrow interpreted lodes resource estimates. Victor Bore: 15m x 2m x 5m based on drilling • Discussion of basis for using or not using pattern of 30m and narrow interpreted lodes grade cutting or capping. • The process of validation, the checking Validation work included checking the block grades against the drilling. This was considered sufficient for process used, the comparison of model data this type and classification of model to drill hole data, and use of reconciliation data if available. Moisture Whether the tonnages are estimated on a dry Tonnages are estimated on a dry basis. No test work basis or with natural moisture, and the was conducted on samples for moisture content or densities. The method used in the resource is based method of determination of the moisture on nearby resources conducted by the competent content. person using below averages for the region. Densities used were oxide 1.8t/m³, transitional 2.2t/m³ and fresh 2.6t/m³ Cut-off The cut-off used in the final resource was 0.5g/t Au The basis of the adopted cut-off grade(s) or parameters quality parameters applied. based on the size and shape of the resource and approximate cost of mining a deposit of this type. 0.5g/t Au has an approximate value of AUD\$50. This will cover mining and processing costs of surface exposed resources to 100m. Mining factors ٠ Assumptions made regarding possible mining The resource is shallow and lacks significant drilling to methods, minimum mining dimensions and make appropriate assessments on mining capability. A or assumptions internal (or, if applicable, external) mining shallow surface exposed resource can be mined dilution. It is always necessary as part of the relatively simply using open cut methods. The vertical process of determining reasonable prospects block size was based on 5m mining benches with 2 for eventual economic extraction to consider flitches. potential mining methods, but the assumptions made regarding mining methods

Criteria **JORC Code explanation** Commentary and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. Metallurgical ٠ The basis for assumptions or predictions No metallurgy has been conducted but nearby factors or regarding metallurgical amenability. It is operations can be assumed for recoverability of assumptions always necessary as part of the process of around 92% to 95% of the gold. determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. Environmen-Assumptions made regarding possible waste No assumptions are made here as the resource is too tal factors or and process residue disposal options. It is preliminary assumptions always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. Bulk density Whether assumed or determined. If assumed, No bulk density determinations have been made. The • the basis for the assumptions. If determined, method used in the resource is based on nearby the method used, whether wet or dry, the resources conducted by the competent person using frequency of the measurements, the nature, below averages for the region. Densities used were size and representativeness of the samples. oxide 1.8t/m³, transitional 2.2t/m³ and fresh 2.6t/m³ The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. Classification The basis for the classification of the Mineral The resource is sufficient to be classified as inferred. ٠ • Resources into varying confidence categories. The drilling density and surface mapping is sufficient Whether appropriate account has been taken to provide some continuity of interpretation but lacks

Criteria	JORC Code explanation	Commentary
A 111	 of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. 	 structural integrity and data density for detailed assessment for a greater classification The classification is considered appropriate by the competent person
Audits or reviews	• The results of any audits or reviews of Mineral Resource estimates.	 No audit or reviews of this assessment has been conducted
Discussion of relative accuracy/ confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates, and, if local, state the relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. 	• The confidence level of this resource is appropriate for inferred only. Sufficient statistical assessment and continuity of interpretation on progressive cross-sections warrants the confidence and also supports the necessary future drilling requirements for an improvement in classification.
