## ASX ANNOUNCEMENT

### Auger results confirm gold, base metals and lithium prospectivity at Mt Short JV

- Complete assays from auger program received.
- Elevated lithium (up to 202 ppm Li<sub>2</sub>O), gold (up to 60ppb), copper (up to 437ppm) and nickel (up to 4090ppm) recorded.
- Infill sampling planned to better define anomalous zones for follow up drill testing.

---

Woomera Mining Limited (ASX: WML) (“Woomera”, “the Company”) has received all assays from the auger drilling programme recently completed on its Mt Short joint venture tenure, near Ravensthorpe in SE Western Australia (Figure 1).

The Mt Short JV, in which Woomera can earn up to a 70% equity interest from Anax Metals Limited (ASX:ANX), is located within the Ravensthorpe greenstone belt which hosts a number of significant mineral deposits including the Allkem’s Mt Cattlin lithium mine, Medallion Metals 1.3Moz Kundip gold (+copper) resource (see ASX:MM8 release dated 9<sup>th</sup> January 2024) and the historically mined high-grade RAV8 nickel deposit (see Figure 1 and ASX:NIS release dated 18<sup>th</sup> October 2021).

1523 auger samples were collected on a 400m by 50m spacing across the Mt Short JV (see Figure 2). There had been no systematic geochemical sampling across the tenement prior to Woomera completing this work.

Significant anomalies defined by Woomera (Figure 3 to 5) include:

- A plus 1.2km long, contiguous lithium anomaly (>150ppm Li<sub>2</sub>O) in the northern part of the tenement.
- A plus 1km long, coincident gold (>20ppb)/tellurium (up to 0.8ppm)/ arsenic (up to 3270ppm) anomaly in the southern part of the tenement.
- A coincident nickel (4,090ppm) /copper (437ppm) anomaly in the central east of the tenement.

Several smaller anomalies were also recorded which will be further assessed.

The gold anomaly on the Mt Short JV is in addition to significant gold anomalism (up to 93ppb Au) defined by previous auger sampling completed by Woomera on its wholly own Mt Cattlin tenement located immediately to the south of the Mt Short JV (Figure 6).

Figure 1: Ravensthorpe Greenstone Belt showing significant mineral deposits and WML tenure.

None of the geochemical lithium anomalies defined by Woomera have been tested by drilling.

Woomera plans to complete an infill sampling program across the Mt Short JV anomalies in the current quarter, which will be followed by drill testing later in the year subject to access relating to local farming activities.

Commenting on the results, Woomera’s Chairman Mr Ian Gordon said “The Ravensthorpe greenstone belt is a well-endowed, multi-commodity geological terrain with a long history of mining. Our latest results confirm the potential for multi-element mineralisation on our tenure and we look forward to following them up.”

This ASX announcement has been approved and authorised for release by the Board of Woomera Mining Ltd.

#### **About Woomera Mining Limited**

Woomera Mining Limited is a focussed mineral explorer. The Company is exploring for battery metals (lithium nickel, copper + PGEs) and gold in the Ravensthorpe Yilgarn and Ashburton areas of Western Australia plus the Musgrave Province in South Australia, along with copper-gold mineralisation in the Gawler Craton of South Australia.

### Competent Persons Statement

The exploration results reported herein, insofar as they relate to mineralisation, are based on information compiled by Mr Ralf Kriege. Mr Kriege is CEO of Woomera Mining Limited and is a Member of the Australasian Institute of Mining and Metallurgy with over 20 years of experience in the field of activity being reported. Mr Kriege has sufficient experience which is relevant to the styles of mineralisation and types of deposit under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' relating to the reporting of Exploration Results. Mr Kriege consents to the inclusion in the report of matters based on his information in the form and context in which it appears.

### Forward Looking Statements

Certain statements in this document are or maybe "forward-looking statements" and represent Woomera's intentions, projections, expectations or beliefs concerning among other things, future exploration activities. The projections, estimates and beliefs contained in such forward-looking statements necessarily involve known and unknown risks, uncertainties and other factors, many of which are beyond the control of Woomera, and which may cause Woomera's actual performance in future periods to differ materially from any express or implied estimates or projections. Nothing in this document is a promise or representation as to the future. Statements

or assumptions in this document as to future matters may prove to be incorrect and differences may be material. Woomera does not make any representation or warranty as to the accuracy of such statements or assumptions.

**Previously Reported Information**

For the purposes of ASX Listing Rule 5.23 the Company confirms that it is not aware of any new information or data that materially affects the information included in the original announcement and that all material assumptions and technical parameters underpinning the estimates in the original announcements continue to apply and have not materially changed.

**ANNEXURE 1.**
**RAVENSTORPE PROJECTS - JORC Code, 2012 Edition – Table 1**
**Section 1 Sampling Techniques and Data**

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <li>• Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>• Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>• Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>• In cases where ‘industry standard’ work has been done this would be relatively simple (e.g., ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>• <u>Outcrop / Float</u> <ul style="list-style-type: none"> <li>- 2-3kg representative rock chip samples collected from outcrop and float.</li> </ul> </li> <li>• <u>Auger</u> <ul style="list-style-type: none"> <li>- samples collected 0.5-2m below the surface using a Landcruiser-mounted drill rig.</li> </ul> </li> <li>• <u>RC Drilling</u> <ul style="list-style-type: none"> <li>- RC drilling was used to collect a ~3kg representative sample each metre for laboratory analysis.</li> <li>- RC samples were collected in 1 metre intervals from a rig mounted cyclone with attached cone splitter. All samples were split into a bulk sample (green bag) with a representative 3kg split (calico).</li> <li>- Composite samples were collected from single metre bulk green bags using a sample spear to ensure a representative sample was combined from selective 2m to 4m intervals, at the discretion of the Site Geologist. In zones of interest 1 metre rig split samples were collected.</li> </ul> </li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li>• Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>• Power auger drilling, using vehicle mounted auger as an open hole technique using continuous flight 4-inch drill bit.</li> <li>• RC drilling utilized a face sampling percussion hammer with 5 5/8 inch</li> </ul>

Criteria	JORC Code explanation	Commentary
		bits.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li>• Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>• Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>• Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<u>RC Drilling</u> <ul style="list-style-type: none"> <li>• RC drill recoveries were visually estimated.</li> <li>• All efforts were made to maintain dry samples however groundwater was encountered in some holes.</li> <li>• Sample recovery was estimated to be good. Some sample loss was encountered at the top of hole.</li> <li>• Drill cyclones were cleaned at the end of each rod or as drilling conditions required</li> </ul>
<i>Logging</i>	<ul style="list-style-type: none"> <li>• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>• Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>• The total length and percentage of the relevant intersections logged.</li> </ul>	<u>RC Drilling</u> <ul style="list-style-type: none"> <li>• All drill chips were geologically logged on site by geologists following the WML logging scheme.</li> <li>• Logging recorded depth, colour, lithology, texture, mineralogy, mineralization and alteration.</li> <li>• All drill holes were logged in full.</li> </ul>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li>• If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>• If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>• For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>• Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>• Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>• Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<u>RC Drilling</u> <ul style="list-style-type: none"> <li>• 1 metre RC drill samples fall through a rotary cone-splitter directly below the rig mounted cyclone. A 2-3 kg sample is collected in a pre-numbered calico bag and lined up in rows with the corresponding plastic bag. Most samples were dry. Wet or dry samples were appropriately recorded.</li> <li>• Duplicate field samples were collected in RC drilling at the rate of 4 per 100 samples (4%) from the cone-splitter.</li> <li>• Certified standards and blanks were <u>each</u> inserted at a rate of four per one hundred samples. In total, 12% control samples are inserted in the drilling samples</li> <li>• Samples were submitted by WML</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>to Nagrom laboratories in Kelmscott and prepared</p> <p><u>Auger</u></p> <ul style="list-style-type: none"> <li>• Samples were submitted by WML staff to ALS laboratories in Wangara and prepared.</li> <li>• Samples were analysed with PREP-31 and ME-MS61L and Au-TL43 techniques respectively.</li> <li>• Samples were prepared by Crushing to 70% less than 2mm, riffle split off 250g, pulverise split to better than 85% passing 75 microns.</li> <li>• Samples were analysed with a 0.75g sample, four acid digest with ICP-MS finish(Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, P, Pb, Rb, RE, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr).</li> <li>• Samples were analysed with an aqua regia extraction with ICP finish for a 25g sample (Au).</li> <li>• Certified standards were <u>each</u> inserted at a rate of two per one hundred samples. In total, 5% control samples are inserted in the drilling samples.</li> </ul>
<p><i>Quality of assay data and laboratory tests</i></p>	<ul style="list-style-type: none"> <li>• <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li>• <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></li> <li>• <i>Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.</i></li> </ul>	<p><u>RC Drilling</u></p> <ul style="list-style-type: none"> <li>• Samples were sent to Nagrom in Perth, sorted, crushed, dried, and pulverized to 80% passing -75µm,</li> <li>• Two Assay suites were applied for the sampling depending on lithologies encountered:</li> <li>• Base metals / Gold suite <ul style="list-style-type: none"> <li>- Samples were sent to Nagrom in Perth, sorted, crushed, dried, and pulverized to 80% passing -75µm,</li> <li>- Prepared sample is fused in a flux to digest. The melt is cooled to collect the precious metals in a lead button. The lead is removed</li> </ul> </li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>by cupellation and the precious metal bead is digested in aqua regia (Au).</p> <ul style="list-style-type: none"> <li>- The digest solution is analysed by ICP(OES)(Au).</li> <li>- Prepared sample is digested with a mixture of acids and boiled to dryness.
