## QUARTERLY EXPLORATION UPDATE

## Highlights

## Mt Gibson Gold Project (MGGP)

- A further 17,023 metres of $R C$ resource definition and extensional drilling was completed at the MGGP during the March 2024 quarter.
- Assays received from 158 resource definition holes (22,851 metres) since the last update in January 2024 continue to return exceptional results within and extensional to the resource including:
- 46 metres @ $2.26 \mathrm{~g} / \mathrm{t}$ from 178 to 224 m
- 32 metres @ $2.38 \mathrm{~g} / \mathrm{t}$ from 220 to 295 m
- 19 metres @ $3.75 \mathrm{~g} / \mathrm{t}$ from 177 to $196 \mathrm{~m}^{*}$
- 12 metres @ $5.28 \mathrm{~g} / \mathrm{t}$ from 90 to 102 m
- 9 metres @ $6.13 \mathrm{~g} / \mathrm{t}$ from 170 to 179 m
* intercept is outside of current resource pit shell
- 19 metres @ 4.42g/t from 276 to $295 m$
- 2 metres @ 37.13g/t from 62 to $64 m$
- 11 metres @ 6.11g/t from 95 to 106 m
- 11 metres @ 5.57/t from 20 to 31 m
- 15 metres @ 3.62/t from 29 to $44 m$
- 89,543 metres of drilling over the last year at the MGGP delivered a 380,000 ounce ( $26 \%$ ) increase to the Ore Reserve Estimate (ORE) to 1.83 million ounces (refer ASX announcement dated 19 April 2024).
- Broad high-grade gold intercepts under the Orion and Lexington pits continue to demonstrate underground mining potential. A 2,000 metre diamond drilling programme to continue testing for extensions to these zones has commenced.
- Drilling on unmined areas at the Comanche prospect, Orion Supergene, Lexington Trend, Tobais Find, Saratoga, Sheldon and Orion North (east of the main Gibson trend) continues to define zones of highgrade mineralisation.
- A total of 9 near mine exploration RC holes for 1,080 metres were completed at the Ace High and Big Whiskey prospects following up first pass AC intercepts reported in the December 2023 quarter. Excellent first pass composite results were returned including:
- 16 metres @ $10.57 \mathrm{~g} / \mathrm{t}$ from 24 to 40 m - 12 metres @ $1.78 \mathrm{~g} / \mathrm{t}$ from 60 to 72 m
- A total of 199 Aircore holes for 10,562 metres were completed across near mine exploration targets. Outstanding first pass composite results were returned including:
- 12 metres @ $3.86 \mathrm{~g} / \mathrm{t}$ from 48 to 60 m - 12 metres @ $2.74 \mathrm{~g} / \mathrm{t}$ from 40 to 52 m

## Karlawinda Gold Project (KGP)

- An RC infill drilling programme of 20,440 metres ( 114 holes) commenced at the Bibra, Southern Corridor and Berwick deposits to infill drill the deeper parts of the deposit to a drill density of $25 \times 25$ metres and allow the conversion of inferred material to indicated category for an update to the KGP ORE in the September 2024 quarter.
- RC results received from RC drilling completed in the December 2023 quarter at the Mumbakine Well and Carnoustie projects. Encouraging results were returned including:
- 8 metres @ 5.90g/t from 27 to 35 m
- 11 metres @ $1.87 \mathrm{~g} / \mathrm{f}$ from 30 to 41 m
- 4 metres @ $2.64 \mathrm{~g} / \mathrm{t}$ from 72 to 76 m
- $\quad 12$ metres @ $0.79 \mathrm{~g} / \mathrm{t}$ from 176 to 188 m
- A 7,059 metre ( 38 holes) RC and 1,230 metre ( 43 holes) AC drilling programme was completed within the Mumbakine Well and Carnoustie project areas during the March 2024 quarter.
- 2,098-line km regional airborne gravity gradiometer and gravity survey completed. Multiple gravity-high anomalies identified along magnetic corridors in proximity to known gold occurrences.

## Mt Gibson Gold Project

Exploration activities at the MGGP during the March 2024 quarter focussed on progressing the extensional and infill resource drilling that commenced in January 2022 as well as near mine exploration drilling at prospects immediately adjacent to the Mt Gibson trend. A total of 380 holes for 37,473 metres of resource, regional exploration and mine development drilling were drilled across the MGGP in the March 2024 quarter. The Company has drilled a total of 2,766 holes for 269,223 metres since acquisition as shown in Figure 1 below.

Figure 1. Completed drilling over the MGGP 8km long mine trend with MRE pit crests.

Assays received since the last update continue to return very encouraging results, including:

| Hole ID | Easting | Northing | From (m) | To (m) | Width (m) | Grade (g/t) |

*Regional 4m Composite Drilling
**Outside of current resource pit shell
A comprehensive table of significant results is included in Appendix 1.
An updated ORE was completed at the MGGP in April 2024 resulting in a 380,000 ounce $(26 \%)$ increase from 1.45 million ounces to 1.83 million ounces. This significant increase was on the basis of the updated Mineral Resource Estimate (MRE) completed in the December 2023 quarter with none of the drilling results received in the March 2024 quarter used in the updated ORE. This drilling will form the basis of future updates to the MGGP MRE and ORE.

## Resource Definition Drilling

Resource definition drilling at the MGGP during the March 2024 quarter focussed on extensional and infill resource drilling under the Orion, Orion North and Lexington pits as well as the unmined areas across the Mt Gibson and Taurus trends.

Current and previously reported drilling at the depth extremities of the resource optimisation shells (where historic drill density is broader spaced) and below them has returned results consistent with Capricorn's geological interpretations of mineralisation location, widths and grade tenor. Drilling across the project to date indicates that mineralisation remains open down dip and along strike to the north and south with multiple stacked lodes intersected.
Continuing extensional drilling to underpin further updates to the MRE and ORE will be targeted in the next twelve months.

The cross sections below (Figures 2-4) show drilling during the quarter intersecting broad mineralisation outside of the current ORE.

Figure 2. Orion North Section with significant open broad mineralisation outside of the current A\$1,900/oz reserve outline.

Figure 3. Orion Section with significant open broad mineralisation outside of the current A\$1,900/oz reserve outline.

Figure 4. Tobias Find Section with shallow open significant broad mineralisation intersected outside of the current $A \$ 1,900 /$ oz reserve outline.
The cross sections below (Figures 5-7) show drilling during the quarter intersecting broad mineralisation outside of the current ORE and MRE.

Figure 5. Orion Supergene Section with shallow open significant broad mineralisation intersected outside of the current $A \$ 1,900 /$ zz reserve outline and $A \$ 2,200 /$ zz resource outline.

Figure 6. Lexington Section with shallow open significant broad mineralisation intersected outside of the current $A \$ 1,900 /$ oz reserve outline and $A \$ 2,200$ /oz resource outline.

Figure 7. Comanche Section with shallow open significant broad mineralisation intersected outside of the current $A \$ 1,900 /$ oz reserve and $\$ 2,200 /$ oz resource outline.

## Underground Potential

Capricorn drilling under the Orion and Lexington pits has returned broad high-grade gold intercepts demonstrating that mineralisation extends significantly at depth and shows the potential for underground mining operations. A 2,000 metre diamond drilling programme has commenced in the current quarter to follow-up four diamond holes drilled in the September 2023 quarter that returned encouraging results.

Diamond and RC Rigs drilling underground and resource targeted holes at Orion Pit
The cross-section below illustrates the high grade zone defined by drilling beneath the Orion pit with the location of proposed underground targeted drillhole.

Figure 8. Orion Section with previously reported intersection and proposed DD Hole.

The strategy to drill incrementally deeper and along strike from current intercepts will continue with a view to maximising the value proposition of the drilling and enhance the prospects for continued success. This will allow the Company to understand the structure, geometry and extent of high-grade zones with a view to developing an underground model in the medium term. Results from current and additional drilling will form the basis to future updates to the projects current MRE and ORE.

## Near Mine Exploration

First pass Aircore and RC drill programmes continued across a number of targets in close proximity to the Mt Gibson mining centre including the Sundance, Gunslinger, Ace High, Crazy Horse and Big Whiskey prospects. A total of 199 AC holes ( 10,562 metres) and 9 RC holes ( 1,080 metres) were completed with drilling intersecting granite, mafic and volcaniclastic lithological contacts. Drilling returned very encouraging 4m composite Au results which highlight the high prospectivity of the area to host further near surface satellite resources as well as major gold discoveries.
Encouragingly the most prospective mineralised zones appear geologically analogous to the Capricorn, Sheldon and Deep South deposits (refer Figure 10-12). Multiple zones of anomalous low-grade Au and pathfinder results were also identified with follow up drilling planned in the June 2024 quarter. Best results included:

- 16 metres @ 10.57g/t from 24 to 40m
- 12 metres @ 3.86g/t from 48 to 60m
- 12 metres @ 1.78g/t from 60 to $72 m$
- 12 metres @ $2.74 \mathrm{~g} / t$ from 40 to 52 m

Figure 9. Completed Sundance drilling

Figure 10. Completed Ace High drilling.

Figure 11. Ace High Section with shallow open significant broad mineralisation

## Karlawinda Gold Project

## Near Mine RC Drilling

During the quarter significant RC results were returned from drilling completed in the December 2023 and March 2024 quarters at the Mumbakine Well project area and Carnoustie prospect. The project areas are proximal to the existing KGP operation and indicate high prospectivity to host further near-surface satellite resources as well as major gold discoveries (refer Figure 13). Encouraging results include:

| Hole_ID | Easting | Northing | From (m) | Depth (m) | Width | Grade (g/t Au) |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| KBAC3217 | 172015 | 7365792 | 102 | 103 | 1 | 18.16 |
| KBAC3219 | 172114 | 7365697 | 27 | 35 | 8 | 5.90 |
| KBAC3223 | 172036 | 7365674 | 30 | 41 | 11 | 1.87 |
| KBRC2144 | 199060 | 7371519 | 72 | 76 | 4 | 2.64 |

A comprehensive table of significant results is included in Appendix 1.

Figure 12. Karlawinda current near mine exploration targets

## Mumbakine Well

The Mumbakine Well project is located 30 kilometres west of Bibra and includes the highly prospective Jim's Vein, Central Lode and the newly identified Wide World prospect. During the March 2024 quarter, 2,390 metres (18 holes) of RC and 1,230 metres ( 43 holes) of AC drilling were completed within the project area. Drilling has been planned based on historic downhole anomalies, soil sampling work completed in the September 2023 quarter and recently acquired gravity survey imagery.
At the Central Lode prospect drilling has returned encouraging shallow first pass gold results over a strike length of +200 m which highlight the areas high prospectivity to host near surface satellite resources as well as major gold discoveries, (refer Figure 14). Mineralisation is hosted in a large ENE shear zone with quartz stockwork vein systems along mafic/sediment contacts and granite/sediment contacts. Follow up drilling is planned for the June 2024 quarter. Best results included:

- 8 metres @ $5.90 \mathrm{~g} / \mathrm{t}$ from 27 to 35 m • 11 metres @ $1.87 \mathrm{~g} / \mathrm{t}$ from 30 to 41 m

Figure 13. Completed drilling at Jims Vein Central Lode prospects.

## Carnoustie

In 2022 a $400 \times 100 \mathrm{~m}$ Aircore gold and arsenic anomaly was identified at the Carnoustie Prospect, approximately 5 km north-west of the Bibra deposit. Follow up first pass RC drilling completed in November 2022 returned encouraging results identifying mineralisation is hosted within an inferred intermediate intrusion. A single RC hole (KBRC2132) for 210 metres was drilled in November 2023 and returned a very encouraging intercept of 7 metres @ $13.53 \mathrm{~g} / \mathrm{t}$ Au from 144 metres (refer ASX announcement 25 January 2024).
Petrographic analysis of the mineralised zone in hole KBRC2132 interpreted the host lithology to be an intrusive porphyritic hornblende microtonalite with strongly mineralised vein material including gold grains and coarse arsenopyrite as shown below:

The occurrence of gold within intrusive lithologies along the Pilbara - Yilgarn craton margin demonstrates the region's prospectivity to host major gold discoveries.
Follow up drilling during the quarter consisted of 20 holes for 4,669 metres. Assays have been received from the first 16 holes of the 20 hole programme with best results including:

- 4 metres @ $2.64 \mathrm{~g} / \mathrm{t}$ from 72 to 76 m - 12 metres @ $0.79 \mathrm{~g} / \mathrm{t}$ from 176 to 188 m

A follow-up programme will be planned once all results from this programme have been received.

## Resource to Reserve Conversion Drilling

A 20,440 metre ( 114 holes) RC drilling programme commenced in the March 2024 quarter across the Bibra, Southern Corridor and Berwick deposits with 5,303 metres ( 38 holes) completed to the end of the quarter. Drilling is targeting areas of the MRE below current ORE pit shell where increased data density is required to underpin Ore Reserve optimisations and studies. All assays are currently pending. Drilling results are to be included in the next MRE and ORE update expected in the September 2024 quarter.

Figure 14. Resource Drilling progress and current A\$1,900/oz ORE and A\$2,200/oz MRE pit design crests

## Regional Falcon Airborne Gravity Gradiometer and Gravity Survey

Results were received from a regional Falcon airborne gravity gradiometer and gravity survey completed in the December 2023 quarter, with processed imagery returned during the March 2024 quarter. The survey was flown at 200 m line spacing, 80 m flight height in an east-west orientation, totalling 2,098 line kilometres. The survey area covers 62 kilometres of strike centred around the Bibra open pit and along the highly prospective Pilbara Yilgarn craton margin. The data has identified geological settings prospective for Bibra style and intrusion related mineralisation including multiple gravity-high anomalies identified along magnetic corridors in proximity to known gold occurrences (refer Figures 15 and 16).

Figure 15. Airborne gravity survey Imagery with current main target locations.

Figure 16. Airborne gravity survey imagery over the Bibra mine area showing multiple gravity-high anomalies along magnetic corridors in proximity to known gold occurrences including +2Moz Bibra deposit.

By successfully defining a large gravity anomaly over the Bibra deposit, the high resolution imagery can be used as a guide to future drill targeting along known trends of gold occurrences. In particular, the survey illustrates the Carnoustie target area lies in proximity to multiple gravity anomalies as well as a number of newly defined gravity highs that have been untested with drilling. Exploration programmes are currently being planned to drill a number of these newly identified gravity anomalies in the coming quarters.

This announcement has been authorised for release by the Capricorn Metals Ltd board.

## Forward Looking Statements

This announcement may contain certain "forward-looking statements" which may not have been based solely on historical facts, but rather may be based on the Company's current expectations about future events and results. Where the Company expresses or implies an expectation of belief as to future events or results, such expectation or belief is expressed in good faith and believed to have a reasonable basis. The detailed reasons for that conclusion are outlined throughout this announcement and all material assumptions are disclosed.

However, forward looking statements are subject to risks, uncertainties, assumptions and other factors, which could cause actual results to differ materially from future results expressed, projected or implied by such forward-looking statements.

Such risks include, but are not limited to resource risk, metals price volatility, currency fluctuations, increased production costs and variances in ore grade or recovery rates from those assumed in mining plans, as well as governmental regulation and judicial outcomes.
For a more detailed discussion of such risks and other factors, see the Company's Annual Reports, as well as the Company's other filings. Readers should not place undue reliance on forward looking information. The Company does not undertake any obligation to release publicly any revisions to any "forward looking statement" to reflect events or circumstances after the date of this announcement, or to reflect the occurrence of unanticipated events, except as may be required under applicable securities laws.

## Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled or reviewed by Mr. William Higgins who is a full-time employee of the Company. Mr. Higgins is a current Member of the Australian Institute of Geoscientists and has sufficient experience, which is relevant to the style of mineralisation and types of deposit under consideration and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr. Higgins consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.
The detailed information relating to the Ore Reserves and Mineral Resources for the Karlawinda Gold Project was contained in the Company's ASX announcement dated 27 July 2023 entitled "Quarterly Exploration and Annual Resource/Reserve Update". The information relating to the Mineral Resource for the Mt Gibson Gold Project Gold Project was contained in the Company's ASX announcement dated 15 December 2023 entitled "Mt Gibson Gold Project Mineral Resources Increase to 3.24 Million Ounces". The information relating to the Ore Reserve for the Mt Gibson Gold Project Gold Project was contained in the Company's ASX announcement dated 19 April 2024 entitled "MGGP Ore Reserve Grows to 1.83 Million Ounces"

The Company confirms that it is not aware of any new information or data that materially affects the information included in the ASX announcements dated 27 July 2023, 15 December 2023 and 19 April 2024 and all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not materially changed from previous market announcements. The reports are available to view on the ASX website and on the Company's website at www.capmetals.com.au
The Competent Person's consents remain in place for subsequent releases by the Company of the same information in the same form and context, until the consent is withdrawn or replaced by subsequent report and accompanying consent.

## APPENDIX 1 - SIGINIFICANT RESULTS

Reported intercepts include a minimum of $0.5 \mathrm{~g} / \mathrm{t}$ Au value over a minimum length of 1 m with a maximum 2 m length of consecutive internal waste. No upper cuts have been applied.

## Appendix 2

JORC Code, 2012 Edition - Table 1

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

## Criteria

## Sampling techniques

## JORC Code explanation

- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.
- Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.
- Aspects of the determination of mineralisation that are Material to the Public Report.
- In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.

## Commentary

RC drilling at KGP and MGGP completed by Topdrill with the same techniques and process at both. For Reverse Circulation (RC) drilling 2 kg - 3 kg samples are split from dry 1 m bulk samples. The sample was collected through a cyclone and cone splitter. Once drilling reached fresh rock a fine spray of water was used to suppress dust and limit the loss of fines thorough the cyclone chimney
For regional first pass RC drilling 1m sample was collected in a bucket and then tipped in neat lines on the ground. The piles were then sampled by using a spear to collect a field composite ( 4 m RC) 2.0 kg to 3.0 kg sample which was then placed in a calico bag. Field duplicates were not collected for the regional RC drilling. CRM were inserted at a ratio of 1:30 composites for regional RC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. +100 200ppb will then have their corresponding 1 m rig split samples sent for fire assay with the below 1 m QAQC applied appropriate for use in JORC resource reporting

1 m RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the origina sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.
Samples were sent to the laboratory where they were pulverised to produce a 50 g charge for fire assay.
For regional aircore exploration (AC) drilling a primary sample was collected from the drill rig. The sample was collected in a bucket and then tipped in neat lines on the ground. The piles were then sampled by using a spear to collect a field composite $(4 \mathrm{~m} \mathrm{AC}) 2.0 \mathrm{~kg}$ to 3.0 kg sample which was then placed in a calico bag. The last 1 m interval for each regional AC hole (EOH) was sampled separately or multi element analysis.
Field duplicates were not collected for the regional AC drilling. CRM were inserted at a ratio of 1:30 composites for regional AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges
Regional AC samples were sent to ALS laboratory where they were pulverised to produce a 25 g charge for aqua regia 51 elements including Au and element multielement analysis for the field composites using ALS code AuME-TL43analysis.
Rock chip samples were taken in the field by CMM geologists during field inspection. Rock samples were collected from surface outcrop. Outcrop samples are considered to be in situ resistant portions of the geology. Samples weighing between 0.5 kg and 3 kg were collected All sample locations were

## Criteria

JORC Code explanation

| Drilling techniques | - Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). |
| :---: | :---: |
| Drill sample recovery | - Method of recording and assessing core and chip sample recoveries and results assessed. <br> - Measures taken to maximise sample recovery and ensure representative nature of the samples. <br> - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. |
| Logging | - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. <br> - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. <br> - The total length and percentage of the relevant intersections logged. |
| Sub-sampling techniques and sample preparation | - If core, whether cut or sawn and whether quarter, half or all core taken. <br> - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. <br> - For all sample types, the nature, quality and appropriateness of the sample preparation technique. <br> - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. <br> - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. <br> - Whether sample sizes are appropriate to the grain size of the material being sampled. |

## Commentary

collected using a hand-held GPS with +/-5m accuracy using MGA zone 51 (GDA94) coordinate system.
RC: Topdrill Drilling drill rig was used to drill the RC drill holes: Hole diameter was 140 mm .
AC: Prospect Drilling was used for AC drilling using an 89 mm blade bit.
RC: Once drilling reached fresh rock a fine spray of water was used to suppress dust and limit the loss of fines thorough the cyclone chimney.
At the end of each metre the bit was lifted off the bottom to separate each metre drilled.
The majority of samples were of good quality with ground water having minimal effect on sample quality or recovery. There is no obvious relationship between sample recovery and grade.

AC: Visual recovery information was collected at the time of the AC drilling.
Reverse circulation chips were washed and stored in chip trays in 1 m intervals for the entire length of each hole. Chip trays were stored on site in a sealed container. Chips were visually inspected and logged by an on-site geologist to record lithology (including rock type, oxidation state, weathering, grain size, colour, mineralogy, and texture), alteration, mineralisation, veining, structure, sample quality (dry/wet, contamination) and approximate water flow down hole. Mineralisation, veining and water flow were quantitative or semi-quantitative in nature; the remainder of logging was qualitative.

Logging is both qualitative and quantitative or semi-quantitative in nature.
AC : AC chips were washed and stored in chip trays in 1 m intervals for the entire length of each hole. Holes of interest are retained, all others are disposed of. Chip trays of all EOH intervals are retained. Chip trays were stored on site in a sealed container. Chips were visually inspected and logged by an on-site geologist to record lithology (including rock type, oxidation state, weathering, grain size, colour, mineralogy, and texture), alteration, mineralisation, veining, structure, sample quality (dry/wet, contamination) and approximate water flow down hole. Mineralisation, veining and water flow were quantitative or semi-quantitative in nature; the remainder of logging was qualitative.

Rockchips CMM Geologists recorded a short geological description of each sample location including lithology, alteration, veining, and mineralization.

RC holes samples were split from dry, 1m bulk samples via a cone splitter directly from the cyclone.
RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.
The duplicates and CRM's were submitted to the lab using unique sample ID's.
$2 \mathrm{~kg}-3 \mathrm{~kg} \mathrm{RC}$ samples are submitted to the laboratory.

## Criteria

## JORC Code explanation

|  |  |
| :---: | :---: |
| Quality of assay data and laboratory tests | - The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. <br> - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. <br> - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. |
| Verification <br> sampling <br> assaying of <br> and | - The verification of significant intersections by either independent or alternative company personnel. <br> - The use of twinned holes. |

## Commentary

Samples are oven dried at $105^{\circ} \mathrm{C}$ then jaw crushed to -10 mm followed by a Boyd crush to a nominal 2 mm . Samples were rotary split to 2.5 kg . Samples were then pulverised in LM5 mills to $85 \%$ passing $75 \mu \mathrm{~m}$ under sample preparation code SP3000 which consists of a 5 -minute extended preparation for $\mathrm{RC} / \mathrm{Soil} / \mathrm{RAB}$. The extended time for the pulverisation is to improve the pulverisation of samples due to the presence of garnets in the samples.

All Bibra Southern Corridor and Berwick samples were analysed for Au using the FA50AAS technique which is a 50 g lead collection fire assay.
All Carnoustie and Central Zone 1 m re-split samples were analysed for Au using the Au-PA01, Au by PhotonAssay Analysis on 500 g of crushed sample
All 4 m composite samples were assayed using ALS AuME-TL43, Au + ME by aqua regia extraction with ICP-MS finish. 25 g sample

This sample preparation technique is appropriate for the MGGP and KGP; and is standard industry practice for a gold deposit.

Samples greater than 3 kg are split prior to pulverizing and the remainder discarded.
Regional AC samples were collected as 4 m field composites using a spear from the individual 1 m sample piles on the ground. Field duplicates were not collected for the regional AC drilling. CRM were inserted at a ratio of 1:30 composites for AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. The CRM's were submitted to the lab using unique sample ID's. $2 \mathrm{~kg}-3 \mathrm{~kg}$ AC samples are submitted to the laboratory. Samples are oven dried at $105^{\circ} \mathrm{C}$ then crushed and pulverised

Rock chips were prepared by ALS PUL-24 preperation code, Dry, crush $\sim 2 \mathrm{~mm}$, pulverise 1.2 kg up to 3 kg .

RC: Drilling samples were submitted to ALS in Perth. 1m RC samples were assayed by either 50 gm fire assay which is a total assay or Au-PA01, Au by PhotonAssay Analysis on 500 g of crushed sample

RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Regional AC drilling samples were submitted to ALS laboratory in Perth. No field duplicates wer collected for the AC drilling. CRM were inserted at a ratio of 1:30 composites for the AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Rock chips were analysed by ALS AuME-TL43 analysis code
Logging and sampling were recorded directly into a Micromine Geobank template, which utilises lookup tables and in file validation on a Toughbook by the geologist on the rig. Validated data was sent to the database administrator in Perth who then carried out independent verifications using

## Criteria

## JORC Code explanation

- Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols
- Discuss any adjustment to assay data.

| Location of data <br> points | -Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), <br> trenches, mine workings and other locations used in Mineral Resource estimation. |
| :--- | :--- | :--- |
|  | -Specification of the grid system used. |

- Specification of the grid system used.
- Quality and adequacy of topographic control

## Commentary

## Maxwell's Datashed.

Assay results when received were plotted on section and were verified against neighbouring holes
QAQC reports were generated on a hole-by-hole basis by the database administrator as results were received.

Capricorn Metals sampling, data collection in field is captured in an electronic logging system for geological, regolith, sample id, assay and surveying information.

All Drillhole collar positions were surveyed using hand held GPS. Drillhole location data was initially captured in the MGA94 grid system. Before further resource evaluation work the drillhole locations will be picked up with DGPS by qualified surveyors.

Down hole surveys were undertaken on 30 m increments from end of hole, using a Reflex down hole gyroscopic tool.

The natural surface topography was modelled using a DTM generated from airborne survey, this includes waste dumps and some in-pit waste dumping. Also available are pit surveys of the mining voids at the end of historical mining to enable depletion of the CMM resource. The pit surveys and topography surface were checked in Google Earth for accuracy. Horizontal point accuracy is expected to be $<5 \mathrm{~m}$ and vertical accuracy to 0.5 m . The reference datum was GDA94 and the projection was MGA Zone 50. Topographic control appears to be of good quality and is considered adequate for resource estimation.

Regional AC drillhole collar positions were surveyed before and after drilling using a handheld GPS Drillhole location data was captured in the MGA94 grid system.

Down hole surveys were not undertaken for the any of the drilling due to the shallow nature of the holes. Any regional AC intercepts will be followed up with infill RC drilling using downhole surveys and more accurate collar survey technique.

Soil and rock chips sample location were captured using a handheld GPS. All GPS data points were later visualised using ARCGIS software to ensure they were recorded in the correct position The grid system used is UTM GDA 94 Zone 5

## RC and DD Samples were collected and analysed for each metre down the hole. Samples were collected and analysed for each metre down the hole. <br> RC hole spacing was between $50 \mathrm{~m} \mathrm{~N} \times 50 \mathrm{mE}$ and 25 m N x 25 m E , sufficient for resource estimation

Regional AC samples were collected and analysed for gold and multielement by 4 m field composites down the hole, with the EOH individual metre sampled separately for multi element analysis. Hole spacing was predominantly $100 \mathrm{~m} \times 400 \mathrm{~m}, 200 \mathrm{~m} \times 200 \mathrm{~m}$ and $50 \mathrm{~m} \times 100 \mathrm{~m}$ for AC .

## Criteria

## JORC Code explanation

|  |  |  |
| :--- | :--- | :--- |
| Orientation of data <br> in relation to <br> geological <br> structure | -Whether the orientation of sampling achieves unbiased sampling of possible structures and the <br> extent to which this is known, considering the deposit type. <br> If the relationship between the drilling orientation and the orientation of key mineralised <br> structures is considered to have introduced a sampling bias, this should be assessed and reported <br> if material. |  |
| Sample security | • The measures taken to ensure sample security. |  |
| Audits or reviews | • The results of any audits or reviews of sampling techniques and data. |  |

## Commentary

down the hole, with the EOH individual metre sampled separately for multi element analysis. Hole spacing was predominantly $100 \mathrm{~m} \times 400 \mathrm{~m}, 200 \mathrm{~m} \times 200 \mathrm{~m}$ and $50 \mathrm{~m} \times 100 \mathrm{~m}$ for AC.

Sample locations for the rockchips were selected based on availability of material to sample in areas of interest.

Drill lines are oriented across strike on an MGA grid. MGGP orebody dips at 80 degrees to the East and KGP 25 degrees to the west.

Holes in the drill Programmes have been mostly drilled at inclination of -55 to -60 degrees at MGGP and KGP. The orientation of the drilling is suitable for the mineralisation style and orientation of the target mineralisation.

Where possible the AC exploration drilling programmes are planned to be drilled perpendicular to the orientation of the geology. Significant mineralisation intervals in the AC will be followed up with infill RC drilling to better understand the orientation of mineralisation.

Calico sample bags are sealed into green bags/polyweave bags and cable tied. These bags were then sealed in bulka bags by company personnel and dispatched by third party contractor. In-company reconciliation is completed with laboratory assay returns.

Soil and rock chip samples collected by CMM and stored on site, prior to being transported to the laboratory ALS.
he Competent Person for Exploration Results reported here has visited the project areas where sampling has taken place and has reviewed and confirmed the sampling procedures.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

## Criteria

## Mineral tenement and land tenure

 status
## JORC Code explanation

- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.
- The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.

## Commentary

MGGP: The resource is located across mining tenements held by wholly owned Capricorn subsidiaries METROVEX PTY LTD and CRIMSON METALS PTY LTD; being M 59/772, E 59/2450, E $59 / 2594$, E $59 / 2606$, G $59 / 11$, G $59 / 12$, G $59 / 13$, G $59 / 14$, G $59 / 15$, G $59 / 16$, G $59 / 17$, G $59 / 18$, G 59/48, G 59/70, L 59/140, L 59/45, L 59/46, L 59/53, M 59/328, M 59/402, M 59/403, M 59/404, P 59/2286, P 59/2287, P 59/2290, P 59/2291, P 59/2306, P 59/2309, P 59/2310.

All of the tenements are subject to a $1 \%$ NSR royalty to Avenger Projects Ltd, including gold production above 90,000 ounces. A royalty is also payable to St Barbara Limited on all gold production in excess of 20,000 ounces (excluding production from historic waste dumps and tailings) production in excess of 20,000 ounces (excluding production from historic waste dumps and tailings)
at the rate of $\$ 10$ per ounce, applicable to leases M $59 / 328$, M 59/402, M $59 / 403$, M 59/404, G 59/11,

G 59/12, G 59/13, G 59/14, G 59/15, G 59/16, G 59/17, G 59/18, L 59/45, L 59/46, L 59/53 No other known impediments exist to operate in the area.

KGP: The Bibra deposit is located in M 52/1070 held by Greenmount Resources, a wholly owned subsidiary of Capricorn Metals.

M52/1070 is within the area of granted E52/1711 exploration tenement in the Pilbara region of Western Australia. E52/1711 was acquired from BHPB in 2008. South32 (via the spin-out from BHPB) retain a $2 \%$ NSR whilst BHPB a claw-back provision whereby BHPB can elect to acquire a $70 \%$ equity in the project only if JORC compliant reported resources of $5,000,000$ ounces of gold and/or 120,000 tonnes of contained nickel have been delineated. The Nyiyaparli People hold Native Title over the area including E52/1711 and M52/1070. There is no known heritage or environmental impediments over the lease.

No other known impediments exist to operate in the area.
MGGP: The Mt Gibson Gold Deposit (Mt Gibson) has a history of minor gold production dating back to the 1930's when prospectors operated small gold workings at Paynes-Crusoe and Tobias Find. While the area was subject to previous prospecting and company exploration in smaller leaseholdings, the Mt. Gibson Gold Project was first held in more-or-less its present configuration and extent by Reynolds Australia, who commenced exploration in the early 1980's. Soil and laterite sampling resulted in several significant gold and base metal anomalies being defined; follow up rotary air blast (RAB), air core (AC), reverse circulation (RC) and diamond drilling Programmes outlined significant economic laterite and oxide resources. A joint venture between Reynolds Australia Metals and Forsayth Mining Limited (with FML as the operator) began operations in 1986, mining and processing 6.5 million tonnes of laterite ores defined by FML in 1984, followed later by oxide and sulphide ores defined by drilling beneath the laterite orebodies. The project was sold by Reynolds to Camelot Resources in 1995. Continuing exploration resulted in the discovery of further oxide resources, mainly on the Taurus Trend, and the underground quartz-sulphide deposit at Wombat. These resources were subsequently mined and processed, all mining being completed at the end of 1997 and final milling of low grade stockpiles completed in June of 1998. A 4Mt dump leach remained in operation until November 1998, producing 68,868 ounces of gold. Including the dump leach, a total of $16,477,882$ tonnes of ore was processed during the life of the operation, for 868,478 ounces of gold at an overall average grade of $1.64 \mathrm{~g} / \mathrm{t} \mathrm{Au}$.

KGP: Prior to Capricorn Metals, E52/1711 was held by Independence group (IGO) who undertook exploration between 2008 \& 2014. Prior to Independence group, WMC (BHPB) explored the area from 2004 to 2008.

MGGP: The Mt Gibson Gold Project tenements are located at the southern extremity of the Retaliation Greenstone Belt, in the SW portion of the Yalgoo-Singleton Greenstone Belt in the Murchison Province of the Yilgarn Craton. The tenements are mostly covered by a veneer of alluvial quartz sands and laterite gravels, with sporadic greenstone subcrop and outcrop, increasingly exposed in the north of the project area. The mineralised laterite gravels are situated slightly down-slope from

## Criteria <br> JORC Code explanation

## Commentary

the lode deposits on the Gibson trend. Regionally, the greenstone belt has been metamorphosed to middle amphibolite facies and hosts a number of $\mathrm{Au}-\mathrm{Cu}$ deposits and prospects, including Golden Grove, 90 km to the northwest of Mt.Gibson

The lode style mineralisation at Mt. Gibson is predominantly hosted by three main trends:

## The Gibson Trend

The majority of the known and mined mineralisation is hosted by this trend. It is hypothesised to have originally been a gold-copper-zinc rich Volcanogenic Hosted Massive Sulphide (VHMS) deposit that has been overprinted by a later hydrothermal gold mineralising event. This mineralised shear zone has an arcuate north-south to northeasterly strike (trending more north-easterly in the north) and extends for more than seven kilometres from the southern granite contact to beyond the Hornet ore body.

The so-called "Mine Sequence" is around 400 metres wide and consists of a parcel of sheared, metamorphosed and chlorite-biotite-muscovite altered mafic volcanics. Numerous felsic porphyries intrude the Mine Sequence. Mineralisation is hosted within multiple sets of elongate lodes with strong strike continuity, which anastomose and pinch-swell along strike and to depth. The main lode systems include Hornet, Enterprise, Orion and S2

## The Taurus Trend

The north-westerly trending Taurus Trend lies west of and diagonal to the Gibson Trend. Mineralisation is intimately associated with an apparently continuous felsic unit emplaced into the northwest trending shear and was discovered late in the life of the mining operation. It is characterised by discontinuous ore bodies, and strongly mineralised quartz-sulphide veining. The ore bodies on this trend include Sheldon and Wombat which, although not as continuous in strike as the ore bodies on the Gibson Trend, show a higher gold tenor.

## The Highway Trend

The Highway Trend is a northeast trending shear zone, hosted by a mafic sequence in the western terrain, 11 km northwest of the main mining area. This trend hosts the Highway ore body, and the Phoenix and Aquarius Prospects. It shares many of the characteristics of the Gibson trend, but it appears to lack the VHMS mineralising event and has generally been regarded as a predominantly low-grade system, although work from previous explores suggest it may have greater persistence and significance than previously thought and hence justifies further attention. The project area also hosts a number of BIF and quartz hosted small mineral occurrences including Paynes-Crusoe and MacDonald's Find

KGP: Bibra is part of a large-scale Archaean aged gold mineralised system. The resource is hosted within a package of deformed meta-sediments which has developed on at least two parallel, shallow dipping structures; Laterite oxide mineralization has developed over the structures close to surface. The primary mineralisation is strata-bound with lineations identified as controlling higher-grade shoots. The deposit is oxidized to average depths of $50-70 \mathrm{~m}$.

## Criteria

## JORC Code explanation

Drill hole
Information

Data aggregation

## methods

 be stated.

- Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.
- The assumptions used for any reporting of metal equivalent values should be clearly stated.
- These relationships are particularly important in the reporting of Exploration Results.
- If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.
- If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').
- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.
- Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of both low and high
- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.
- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).
- Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.

## Commentary

All relevant drillhole information can be found in section 1 - "Sampling techniques", "Drilling techniques" and "Drill Sample Recovery" and the significant intercepts table.

Reported intercepts include a minimum of $0.5 \mathrm{~g} / \mathrm{t}$ Au value over a minimum length of 1 m with a maximum 2 m length of consecutive internal waste. No upper cuts have been applied. No aggregation methods have been applied for the rockchips. No metal equivalent values are used.

MGGP: The mineralisation dips steeply to the east, and drilling is generally orientated at 60 degrees to the west, meaning intercepts are roughly perpendicular to mineralisation in the majority of cases. Some vertical holes drilled from the base of mined pits and are therefore at a high degree to the mineralisation.
KGP: At Bibra, the geometry of the mineralisation has already been defined from previous drilling programs. The intersection angle between drill angle and the perpendicular angle to the ore zone is less than 10 degrees.

Refer to the diagrams in the body of this report.

The accompanying document is considered to be a balanced report with a suitable cautionary note.

No other material information or data to report

Further work includes continued resource infill RC drilling at both projects.

## Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

| Criter'a | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Database integrity | - Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. <br> - Data validation procedures used. | No Mineral Resource Estimation update being reported. |
| Site visits | - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. <br> - If no site visits have been undertaken indicate why this is the case. | No Mineral Resource Estimation update being reported. |
| Geological interpretation | - Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. <br> - Nature of the data used and of any assumptions made. <br> - The effect, if any, of alternative interpretations on Mineral Resource estimation. <br> - The use of geology in guiding and controlling Mineral Resource estimation. <br> - The factors affecting continuity both of grade and geology. | No Mineral Resource Estimation update being reported. |
| Dimensions | - The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. | No Mineral Resource Estimation update being reported. |
| Estimation and modelling techniques | - The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. <br> - The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. <br> - The assumptions made regarding recovery of by-products. <br> - Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). <br> - In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. <br> - Any assumptions behind modelling of selective mining units. <br> - Any assumptions about correlation between variables. <br> - Description of how the geological interpretation was used to control the resource estimates. <br> - Discussion of basis for using or not using grade cutting or capping. <br> - The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. | No Mineral Resource Estimation update being reported. |
| Moisture | - Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | No Mineral Resource Estimation update being reported. |
| Cut-off parameters | - The basis of the adopted cut-off grade(s) or quality parameters applied. | No Mineral Resource Estimation update being reported. |
| Mining factors or assumptions | - Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating | No Mineral Resource Estimation update being reported. |

## Criteria

## JORC Code explanation

Mineral Resources may not always be rigorous. Where this is the case, this should be reported
with an explanation of the basis of the mining assumptions made.

| Metallurgical <br> factors <br> assumptions |
| :--- | :--- |

factors
assumptions
The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.
Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.
Bulk density

- Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.
- The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit
- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.
Classification
- The basis for the classification of the Mineral Resources into varying confidence categories.
- Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).
- Whether the result appropriately reflects the Competent Person's view of the deposit.

Audits or reviews

- The results of any audits or reviews of Mineral Resource estimates.
- Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.

| Mining factors or |

## JORC Code explanation

Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.

- Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.
- Comment on any site visits undertaken by the Competent Person and the outcome of those visits.
- If no site visits have been undertaken indicate why this is the case.
- The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.
- The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.
- The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).
- The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.
- The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.
- The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).
- The mining dilution factors used.
- The mining recovery factors used
- Any minimum mining widths used
- The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.
- The infrastructure requirements of the selected mining methods.

## Metallurgical

factors
assumptions

The metallurgical process proposed and the appropriateness of that process to the style of isation.
Whether the metallurgical process is well-tested technology or novel in nature.
The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.

- Any assumptions or allowances made for deleterious elements.
- The existence of any bulk sample or pilot scale test work and the degree to which such samples

## Criteria

## JORC Code explanation

- The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.

| Classification |
| :--- |
| Audits or reviews |
| Discussion of <br> relative accuracy/ <br> confidence |

- The basis for the classification of the Ore Reserves into varying confidence categories.
- Whether the result appropriately reflects the Competent Person's view of the deposit.
- The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).
- The results of any audits or reviews of Ore Reserve estimates.
- Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.
- It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.

## Commentary

Samples are oven dried at $105^{\circ} \mathrm{C}$ then jaw crushed to -10 mm followed by a Boyd crush to a nominal -2 mm . Samples were rotary split to 2.5 kg . Samples were then pulverised in LM5 mills to $85 \%$ passing $75 \mu \mathrm{~m}$ under sample preparation code SP3000 which consists of a 5 -minute extended preparation for $\mathrm{RC} / \mathrm{Soil} / \mathrm{RAB}$. The extended time for the pulverisation is to improve the pulverisation of samples due to the presence of garnets in the samples.

All Bibra Southern Corridor and Berwick samples were analysed for Au using the FA50AAS technique which is a 50 g lead collection fire assay.
All Carnoustie and Central Zone 1 m re-split samples were analysed for Au using the Au-PA01, Au by PhotonAssay Analysis on 500 g of crushed sample
All 4 m composite samples were assayed using ALS AuME-TL43, Au + ME by aqua regia extraction with ICP-MS finish. 25 g sample

This sample preparation technique is appropriate for the MGGP and KGP; and is standard industry practice for a gold deposit.

Samples greater than 3 kg are split prior to pulverizing and the remainder discarded.
Regional AC samples were collected as 4 m field composites using a spear from the individual 1 m sample piles on the ground. Field duplicates were not collected for the regional AC drilling. CRM were inserted at a ratio of 1:30 composites for AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. The CRM's were submitted to the lab using unique sample ID's. $2 \mathrm{~kg}-3 \mathrm{~kg}$ AC samples are submitted to the laboratory. Samples are oven dried at $105^{\circ} \mathrm{C}$ then crushed and pulverised

Rock chips were prepared by ALS PUL-24 preperation code, Dry, crush $\sim 2 \mathrm{~mm}$, pulverise 1.2 kg up to 3 kg .

RC: Drilling samples were submitted to ALS in Perth. 1m RC samples were assayed by either 50 gm fire assay which is a total assay or Au-PA01, Au by PhotonAssay Analysis on 500 g of crushed sample

RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Regional AC drilling samples were submitted to ALS laboratory in Perth. No field duplicates wer collected for the AC drilling. CRM were inserted at a ratio of 1:30 composites for the AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Rock chips were analysed by ALS AuME-TL43 analysis code
Logging and sampling were recorded directly into a Micromine Geobank template, which utilises lookup tables and in file validation on a Toughbook by the geologist on the rig. Validated data was sent to the database administrator in Perth who then carried out independent verifications using

## Criteria

|  |  |  |
| :--- | :--- | :--- |
| Orientation of data <br> in relation to <br> geological <br> structure | Whether the orientation of sampling achieves unbiased sampling of possible structures and the <br> extent to which this is known, considering the deposit type. <br> If the relationship between the drilling orientation and the orientation of key mineralised <br> structures is considered to have introduced a sampling bias, this should be assessed and reported <br> if material. |  |
| Sample security | • The measures taken to ensure sample security. |  |
| Audits or reviews | • The results of any audits or reviews of sampling techniques and data. |  |

## Commentary

Sample locations for the rockchips were selected based on availability of material to sample in areas of interest.

Drill lines are oriented across strike on an MGA grid. MGGP orebody dips at 80 degrees to the East and KGP 25 degrees to the west.

Holes in the drill Programmes have been mostly drilled at inclination of -55 to - 60 degrees at MGGP and KGP. The orientation of the drilling is suitable for the mineralisation style and orientation of the target mineralisation.

Where possible the AC exploration drilling programmes are planned to be drilled perpendicular to the orientation of the geology. Significant mineralisation intervals in the AC will be followed up with infill RC drilling to better understand the orientation of mineralisation

Calico sample bags are sealed into green bags/polyweave bags and cable tied. These bags were then sealed in bulka bags by company personnel and dispatched by third party contractor. In-company reconciliation is completed with laboratory assay returns.
Soil and rock chip samples collected by CMM and stored on site, prior to being transported to the laboratory ALS.
The Competent Person for Exploration Results reported here has visited the project areas where sampling has taken place and has reviewed and confirmed the sampling procedures.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Mineral tenement and land tenure status

JORC Code explanation

- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.
- The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.

## Commentary

MGGP: The resource is located across mining tenements held by wholly owned Capricorn subsidiaries METROVEX PTY LTD and CRIMSON METALS PTY LTD; being M 59/772, E 59/2450, E 59/2594, E 59/2606, G 59/11, G 59/12, G 59/13, G 59/14, G 59/15, G 59/16, G 59/17, G 59/18, G 59/48, G 59/70, L 59/140, L 59/45, L 59/46, L 59/53, M 59/328, M 59/402, M 59/403, M 59/404, P 59/2286, P 59/2287, P 59/2290, P 59/2291, P 59/2306, P 59/2309, P 59/2310.

All of the tenements are subject to a $1 \%$ NSR royalty to Avenger Projects Ltd, including gold production above 90,000 ounces. A royalty is also payable to St Barbara Limited on all gold production in excess of 20,000 ounces (excluding production from historic waste dumps and tailings) at the rate of $\$ 10$ per ounce, applicable to leases M $59 / 328$, M $59 / 402$, M $59 / 403$, M 59/404, G 59/11 G 59/12, G 59/13, G 59/14, G 59/15, G 59/16, G 59/17, G 59/18, L 59/45, L 59/46, L 59/53 No other known impediments exist to operate in the area.

## Criteria <br> JORC Code explanation

## Commentary

KGP: The Bibra deposit is located in M 52/1070 held by Greenmount Resources, a wholly owned subsidiary of Capricorn Metals.
M52/1070 is within the area of granted E52/1711 exploration tenement in the Pilbara region of Western Australia. E52/1711 was acquired from BHPB in 2008. South32 (via the spin-out from BHPB) retain a $2 \%$ NSR whilst BHPB a claw-back provision whereby BHPB can elect to acquire a $70 \%$ equity in the project only if JORC compliant reported resources of $5,000,000$ ounces of gold and/or 120,000 tonnes of contained nickel have been delineated. The Nyiyaparli People hold Native Title over the area including E52/1711 and M52/1070. There is no known heritage or environmental impediments over the lease.
No other known impediments exist to operate in the area.
MGGP: The Mt Gibson Gold Deposit (Mt Gibson) has a history of minor gold production dating back to the 1930's when prospectors operated small gold workings at Paynes-Crusoe and Tobias Find. While the area was subject to previous prospecting and company exploration in smaller leaseholdings, the Mt. Gibson Gold Project was first held in more-or-less its present configuration and extent by Reynolds Australia, who commenced exploration in the early 1980's. Soil and laterite sampling resulted in several significant gold and base metal anomalies being defined; follow up rotary air blast (RAB), air core (AC), reverse circulation (RC) and diamond drilling Programmes outlined significant economic laterite and oxide resources. A joint venture between Reynolds Australia Metals and Forsayth Mining Limited (with FML as the operator) began operations in 1986, mining and processing 6.5 million tonnes of laterite ores defined by FML in 1984, followed later by oxide and sulphide ores defined by drilling beneath the laterite orebodies. The project was sold by Reynolds to Camelot Resources in 1995. Continuing exploration resulted in the discovery of further oxide resources, mainly on the Taurus Trend, and the underground quartz-sulphide deposit at Wombat. These resources were subsequently mined and processed, all mining being completed at the end of 1997 and final milling of low grade stockpiles completed in June of 1998. A 4Mt dump leach remained in operation until November 1998, producing 68,868 ounces of gold. Including the dump leach, a total of $16,477,882$ tonnes of ore was processed during the life of the operation, for 868,478 ounces of gold at an overall average grade of $1.64 \mathrm{~g} / \mathrm{t} \mathrm{Au}$

KGP: Prior to Capricorn Metals, E52/1711 was held by Independence group (IGO) who undertook exploration between 2008 \& 2014. Prior to Independence group, WMC (BHPB) explored the area from 2004 to 2008.

MGGP: The Mt Gibson Gold Project tenements are located at the southern extremity of the Retaliation Greenstone Belt, in the SW portion of the Yalgoo-Singleton Greenstone Belt in the Murchison Province of the Yilgarn Craton. The tenements are mostly covered by a veneer of alluvial quartz sands and laterite gravels, with sporadic greenstone subcrop and outcrop, increasingly exposed in the north of the project area. The mineralised laterite gravels are situated slightly down-slope from the lode deposits on the Gibson trend. Regionally, the greenstone belt has been metamorphosed to middle amphibolite facies and hosts a number of $\mathrm{Au}-\mathrm{Cu}$ deposits and prospects, including Golden Grove, 90 km to the northwest of Mt.Gibson.

## Commentary

The lode style mineralisation at Mt. Gibson is predominantly hosted by three main trends:

## The Gibson Trend

The majority of the known and mined mineralisation is hosted by this trend. It is hypothesised to have originally been a gold-copper-zinc rich Volcanogenic Hosted Massive Sulphide (VHMS) deposit that has been overprinted by a later hydrothermal gold mineralising event. This mineralised shear zone has an arcuate north-south to northeasterly strike (trending more north-easterly in the north) and extends for more than seven kilometres from the southern granite contact to beyond the Hornet ore body.
The so-called "Mine Sequence" is around 400 metres wide and consists of a parcel of sheared, metamorphosed and chlorite-biotite-muscovite altered mafic volcanics. Numerous felsic porphyries intrude the Mine Sequence. Mineralisation is hosted within multiple sets of elongate lodes with strong strike continuity, which anastomose and pinch-swell along strike and to depth. The main lode systems include Hornet, Enterprise, Orion and S2.

## The Taurus Trend

The north-westerly trending Taurus Trend lies west of and diagonal to the Gibson Trend. Mineralisation is intimately associated with an apparently continuous felsic unit emplaced into the northwest trending shear and was discovered late in the life of the mining operation. It is characterised by discontinuous ore bodies, and strongly mineralised quartz-sulphide veining. The ore bodies on this trend include Sheldon and Wombat which, although not as continuous in strike as the ore bodies on the Gibson Trend, show a higher gold tenor.

## The Highway Trend

The Highway Trend is a northeast trending shear zone, hosted by a mafic sequence in the western terrain, 11 km northwest of the main mining area. This trend hosts the Highway ore body, and the Phoenix and Aquarius Prospects. It shares many of the characteristics of the Gibson trend, but it appears to lack the VHMS mineralising event and has generally been regarded as a predominantly low-grade system, although work from previous explores suggest it may have greater persistence and significance than previously thought and hence justifies further attention. The project area also hosts a number of BIF and quartz hosted small mineral occurrences including Paynes-Crusoe and MacDonald's Find

KGP: Bibra is part of a large-scale Archaean aged gold mineralised system. The resource is hosted within a package of deformed meta-sediments which has developed on at least two parallel, shallow dipping structures; Laterite oxide mineralization has developed over the structures close to surface. The primary mineralisation is strata-bound with lineations identified as controlling higher-grade shoots. The deposit is oxidized to average depths of $50-70 \mathrm{~m}$.

All relevant drillhole information can be found in section 1 - "Sampling techniques", "Drilling techniques" and "Drill Sample Recovery" and the significant intercepts table.

## Criteria

## JORC Code explanation

- dip and azimuth of the hole
- down hole length and interception depth
- hole length.
- If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.
- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.
- Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.
- The assumptions used for any reporting of metal equivalent values should be clearly stated.

Relationship
between
mineralisation
widths and
intercept lengths

| Diagrams |
| :--- |
| Balanced <br> reporting |
| Other substantive <br> exploration data |

Further work

- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view any significant discovery being reported These should include,
of drill hole collar locations and appropriate sectional views.
- Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.
- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater geotechnical and rock characteristics; potential deleterious or contaminating substances.
- These relationships are particularly important in the reporting of Exploration Results.
- If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.
- If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').
- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).
- Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive .

## Commentary

 maximum 2 m length of consecutive internal waste. No upper cuts have been applied. No aggregation methods have been applied for the rockchips. No metal equivalent values are used.MGGP: The mineralisation dips steeply to the east, and drilling is generally orientated at 60 degrees to the west, meaning intercepts are roughly perpendicular to mineralisation in the majority of cases. Some vertical holes drilled from the base of mined pits and are therefore at a high degree to the mineralisation.

KGP: At Bibra, the geometry of the mineralisation has already been defined from previous drilling programs. The intersection angle between drill angle and the perpendicular angle to the ore zone is less than 10 degrees.

Refer to the diagrams in the body of this report.

The accompanying document is considered to be a balanced report with a suitable cautionary note

No other material information or data to report

Further work includes continued resource infill RC drilling at both projects.

## Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

| Moisture | - Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | No Mineral Resource Estimation update being reported. |
| Cut-off parameters | - The basis of the adopted cut-off grade(s) or quality parameters applied. | No Mineral Resource Estimation update being reported. |
| Mining factors or assumptions | - Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating | No Mineral Resource Estimation update being reported. |

## Criteria

## JORC Code explanation

Mineral Resources may not always be rigorous. Where this is the case, this should be reported
with an explanation of the basis of the mining assumptions made.

| Metallurgical <br> factors <br> assumptions |
| :--- | :--- |

factors
assumptions
The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.
Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.
Bulk density

- Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.
- The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit
- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.
Classification
- The basis for the classification of the Mineral Resources into varying confidence categories.
- Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).
- Whether the result appropriately reflects the Competent Person's view of the deposit.

Audits or reviews

- The results of any audits or reviews of Mineral Resource estimates.
- Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.

## JORC Code explanation

Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.

- Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.
- Comment on any site visits undertaken by the Competent Person and the outcome of those visits.
- If no site visits have been undertaken indicate why this is the case.
- The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.
- The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.

## assumptions

## Metallurgical

factors
assumptions

- The basis of the cut-off grade(s) or quality parameters applied.
- The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).
- The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.
- The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.
- The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).
- The mining dilution factors used.
- The mining recovery factors used.
- Any minimum mining widths used
- The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.
- The infrastructure requirements of the selected mining methods.
- The metallurgical process proposed and the appropriateness of that process to the style of eralisation.
Whether the metallurgical process is well-tested technology or novel in nature.
- The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.
- Any assumptions or allowances made for deleterious elements.
- The existence of any bulk sample or pilot scale test work and the degree to which such samples

## Criteria

## JORC Code explanation

- The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.

| Classification |
| :--- |
| Audits or reviews |
| Discussion of <br> relative accuracy/ <br> confidence |

- The basis for the classification of the Ore Reserves into varying confidence categories.
- Whether the result appropriately reflects the Competent Person's view of the deposit.
- The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).
- The results of any audits or reviews of Ore Reserve estimates.
- Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.
- It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.
