# MAIDEN SCANDIUM RESOURCE DECLARED AT SALAZAR

## Highlights

- Maiden **Scandium Mineral Resource** estimate at Newmont, part of the Salazar Critical Minerals Project
- **12 Mt of 103 ppm Sc** Inferred Mineral Resource (JORC 2012) declared for the Newmont deposit
- Preliminary metallurgical testwork reports high scandium leach recovery up to 81.2% at atmospheric pressure<sup>1</sup>
- Scandium may add significant value to rare earths, titanium dioxide and alumina co-products at Newmont
- Previously reported Mineral Resources (JORC 2012) at the Newmont Deposit are:
  - **Rare earth elements**<sup>2</sup> – 83 Mt at 1117 ppm TREO (Indicated + Inferred, 600 ppm TREO cut-off)<sup>3</sup>
  - **Titanium dioxide**<sup>4</sup> - 29 Mt of 5.01% TiO<sub>2</sub> and 942 ppm TREO (2% Ti cut-off)
  - **Alumina**<sup>4</sup> - 4 Mt at 29.6% Al<sub>2</sub>O<sub>3</sub>, (15% Al cut-off) potentially suitable to be upgraded to a high-grade high purity alumina (HPA) feedstock
- Potential to expand mineral resource estimates

West Cobar Metals Limited (**ASX: WC1**) (“**West Cobar**”, “**the Company**”) is pleased to announce a maiden Mineral Resource estimate for scandium, adding to the already valuable basket of minerals hosted at the Company’s 100%-owned Salazar Project, 120 km north-east of Esperance in southern Western Australia.

The Salazar Project is one of the most advanced clay-hosted critical minerals projects in Australia, containing significant Indicated and Inferred Mineral Resources of rare earth elements and Inferred Mineral Resources of titanium dioxide, and alumina.

Scandium is a lightweight metal used in alloys and Solid Oxide Fuel Cells (SOFC), the aerospace and defence industry, lighting, electronics, ceramics and 3D printing amongst other uses. The potentially recoverable high value scandium is likely to significantly boost the Salazar project’s economics.

In addition to rare earths, titanium metal and gallium contained in the Salazar Critical Minerals Project, scandium is listed as a critical mineral by the US Geological Survey, European Commission and the Australian Department of Industry, Science and Resources.

(source: <https://www.industry.gov.au/publications/australias-critical-minerals-list-and-strategic-materials-list>).

<sup>3</sup> TREO = La<sub>2</sub>O<sub>3</sub> + CeO<sub>2</sub> + Pr<sub>6</sub>O<sub>11</sub> + Nd<sub>2</sub>O<sub>3</sub> + Sm<sub>2</sub>O<sub>3</sub> + Eu<sub>2</sub>O<sub>3</sub> + Gd<sub>2</sub>O<sub>3</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> + Ho<sub>2</sub>O<sub>3</sub> + Er<sub>2</sub>O<sub>3</sub> + Tm<sub>2</sub>O<sub>3</sub> + Yb<sub>2</sub>O<sub>3</sub> + Lu<sub>2</sub>O<sub>3</sub> + Y<sub>2</sub>O<sub>3</sub>

<sup>4</sup> West Cobar Metals ASX release, ‘Significant Co Product resources add value and optionality to Newmont REE deposit’, 27 September 2023

**West Cobar Metals' Managing Director, Matt Szwedzicki, commented:** "We are excited to report a maiden Mineral Resource estimate for scandium as an additional co-product at the Newmont deposit in addition to rare earth elements, titanium dioxide and alumina. Scandium is a very high-value critical mineral (the current scandium oxide price<sup>5</sup> is circa US\$856 per kg) which has the potential to enhance the overall project economics. Furthermore, the addition of scandium to the growing list of critical minerals already reported at Newmont highlights the potential geopolitical significance of Newmont.

The unique mineralogy of the Newmont deposit simplifies the processing options. Historical sighter level testwork demonstrates that excellent leaching recoveries are achievable at atmospheric pressure and could enable competitive extraction costs. Importantly, the unusual mineralogy points to the application of comparatively straightforward processing technologies. Metallurgical and beneficiation test work is currently moving ahead rapidly to develop a viable multi-product extraction pathway."

## Salazar Critical Minerals Project

The Salazar Critical Minerals Project (consisting of the Newmont and O'Connor deposits and exploration licences covering 1,171 km<sup>2</sup>) is situated in the Esperance district approximately 120 km north-east of the township of Esperance. All the project's tenements are located on non-agricultural undeveloped state land. The project features some of the highest grade saprolitic clay-hosted rare earth elements (REEs) and co-product resources discovered in Australia. Potentially economic concentrations of REEs, titanium dioxide (TiO<sub>2</sub>), alumina and scandium occur in the overlying saprolitic clays favoured by likely low mining cost and non-refractory extractability.

West Cobar's Newmont Deposit contains a large Indicated and Inferred REE Mineral Resource which stands at **83Mt at 1117 ppm total rare earth oxide**<sup>2</sup> as well as a TiO<sub>2</sub> Inferred Mineral Resource (**29Mt at 5.0% TiO<sub>2</sub>**)<sup>4</sup> and an alumina Inferred Mineral Resource (**4Mt at 29.6% Al<sub>2</sub>O<sub>3</sub>**)<sup>4</sup>.

## Scandium Mineral Resource Estimate – Newmont Deposit

AMC Consultants were engaged to upgrade the Newmont Mineral Resource for scandium and have estimated an Inferred Resource of **12Mt of 103 ppm Sc using a cut-off of 75 ppm Sc**.

| Cut-off Sc ppm | CATEGORY     | Saprolite Zone | Mt        | Sc ppm     | TREO ppm   | Ti %        | TiO <sub>2</sub> % |
|----------------|--------------|----------------|-----------|------------|------------|-------------|--------------------|
| 75             | Inferred     | TREO>=600      | 8         | 103        | 1,192      | 3.18        | 5.30               |
|                | Inferred     | TREO<600       | 4         | 103        | 415        | 2.61        | 4.35               |
|                | <b>Total</b> |                | <b>12</b> | <b>103</b> | <b>915</b> | <b>2.97</b> | <b>4.95</b>        |

Table notes:

Saprolite 8 Mt >=600ppm TREO is contained within the current Newmont Mineral Resource estimate.

Saprolite 4 Mt <600ppm TREO is additional to the current Newmont MRE.

The model is currently not reported within a constraining nominal pit shell of any sort. This might change in future reporting.

**Table 1: Newmont Deposit, Inferred Scandium Mineral Resource (JORC Code 2012)**

<sup>5</sup> SMM: <https://www.metal.com/Rare-Earth-Oxides>. Accessed 24-April-2024

Scandium enrichment in saprolite is within and adjacent to the Newmont REE and TiO<sub>2</sub> estimated Mineral Resources<sup>2,4</sup> where it is derived from underlying amphibolite (Figures 1,2 and 3). There is widespread scandium mineralisation throughout the TREO / TiO<sub>2</sub> mineralised saprolitic clays at Newmont. with best intercepts<sup>6</sup> of:

- SAC358, **13 m of 207 ppm Sc from 9 m,**
  - **includes 3 m of 423 ppm Sc from 10 m**
- SAC391, **11 m of 184 ppm Sc from 6 m,**
  - **includes 4 m of 228 ppm Sc from 9 m**
- SZA070, **8 m of 139 ppm Sc from 23 m**
- SZA111, **10 m of 166 ppm Sc from 12 m**
- SZA112, **6 m of 177 ppm Sc from 9 m**

Historical drill data shows that the underlying amphibolite bedrock contains an anomalous 20 to 80 ppm Sc. It is locally enriched in the overlying clay saprolite where chemical changes have also produced a more leachable mineralogy.

A number of Australian scandium deposits are hosted in lateritic host rocks. The Salazar project is distinctive as the scandium is hosted in lower iron content saprolitic clays making the scandium potentially easier and cheaper to recover. Testwork results from saprolite at Newmont show high scandium leach recovery up to 81.2% at atmospheric pressure.<sup>1</sup>

Current metallurgical works are enabling the company to focus development studies on a project which would have a Ti product stream (ilmenite concentrate), a rare earth element (REE) stream and scandium as a co-product.

There are very few sources of scandium supply globally. In what may be perceived as an indication of the growing strategic interest in the metal, Rio Tinto Ltd recently purchased the Owendale scandium deposit in NSW<sup>7</sup> and established a dedicated scandium business unit.

There is significant potential within the existing exploration licences to considerably extend the scandium (and REE, TiO<sub>2</sub>) resources at Newmont (Figure 3) with an air core drilling program to test for extensions planned to commence during Q2 2024.

## Scandium Overview

### *Scandium Uses and Prices*

Scandium is a lightweight soft metal used in alloys and Solid Oxide Fuel Cells (SOFC), the aerospace and defence industry, lighting, electronics, ceramics and 3D printing amongst other uses.

When alloyed with aluminium, scandium significantly strengthens the aluminium alloys and enables them to be reliably welded leading to reductions in manufacturing costs. This factor is a significant aspect of aircraft manufacturing where 0.1% to 0.5% scandium in the aluminium alloys has a significant impact on the resulting strength of the alloy as well as a significant weight reduction of the aircraft. This in turn leads to less CO<sub>2</sub> produced per air mile and more efficient aircraft with higher payload capacity.

Scandium plays an important role in enhancing the performance and efficiency of SOFCs, which are devices that convert chemical energy into electrical energy. SOFCs use hydrogen or hydrocarbon fuels and oxygen to produce electricity, making them suitable for various applications, such as power generation and industrial processes<sup>8</sup>. A benefit of adding scandium to the zirconia-based electrolyte in SOFC's is that it lowers the operating temperature of the SOFCs compared to conventional high-temperature SOFCs. Lowering the operating temperature has several advantages, such as reducing thermal stress on cell components and extending cell lifespan. Solid Oxide Fuel Cells represent a key source of demand growth for scandium in the near term and are aligned to a low carbon world.

Scandium is a high value critical metal, with scandium oxides currently priced <sup>5</sup> at about US\$856 per kg which would add significant value to a recoverable rare earth element product.

### *Scandium Sources*

There are no primary scandium mines currently operating in the world.<sup>8</sup>

Scandium is typically obtained as a by-product from other mining operations, such as the extraction of rare earth elements (REE), uranium, nickel-cobalt, titanium, vanadium, or other metals.

Scandium production has historically originated from China, Russia and Ukraine.

### *Scandium Demand*

The current scandium market is small with approximately 20 to 30 tonnes in demand for 2022, however forecasters are predicting strong growth due to the metal's unique properties. Much more widespread usage of scandium is believed to be constrained by limited global supply.

<sup>8</sup>eResearch Industry Report, scandium – A metal for green future, Oct 2023.

## SALAZAR CRITICAL MINERALS PROJECT

### Rare Earths, Titanium Dioxide, Alumina Resources

In addition to the current scandium estimated Mineral Resource, AMC Consultants have previously estimated Indicated and Inferred Mineral Resources for Rare Earth Elements and Inferred Mineral Resources for HPA-alumina and titanium dioxide.

### Salazar Critical Metals Project - Rare Earths

The current Inferred + Indicated Resource of Rare Earth Elements at Newmont is 83Mt at 1117ppm TREO (600ppm TREO cut-off)<sup>2</sup>.

Most of the basket value is derived from the 'magnet' rare earths: neodymium, praseodymium, dysprosium and terbium oxides, which together comprise about 25% of the total TREO content at Newmont. The heavy magnet rare earths dysprosium and terbium are relatively high compared to other clay hosted rare earth deposits (Table 1). While they make up 3.0% and 0.5% respectively of the total rare earth element content, they represent approximately 40% of the REE basket value. Deleterious radioactive elements uranium and thorium are at very low levels and they are not concentrated during the leach process.

| Cut-off (TREO ppm) | Deposit      | Category                    | Tonnes (Mt) | TREO <sup>3</sup> (ppm) | Pr <sub>6</sub> O <sub>11</sub> ppm | Nd <sub>2</sub> O <sub>3</sub> ppm | Dy <sub>2</sub> O <sub>3</sub> ppm | Tb <sub>4</sub> O <sub>7</sub> ppm |
|--------------------|--------------|-----------------------------|-------------|-------------------------|-------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 600                | Newmont      | Indicated                   | 39          | 1216                    | 51                                  | 206                                | 36                                 | 6.1                                |
|                    |              | Inferred                    | 44          | 1029                    | 46                                  | 180                                | 29                                 | 5.1                                |
|                    |              | Indicated + Inferred        | 83          | 1117                    | 48                                  | 192                                | 33                                 | 5.6                                |
|                    | O'Connor     | Inferred                    | 107         | 1216                    | 61                                  | 195                                | 11                                 | 2.3                                |
|                    | <b>TOTAL</b> | <b>Indicated + Inferred</b> | <b>190</b>  | <b>1172</b>             | <b>55</b>                           | <b>194</b>                         | <b>21</b>                          | <b>4.5</b>                         |

Table 2: Salazar Critical Minerals Project - Newmont and O'Connor Deposits - Indicated and Inferred TREO Mineral Resource (JORC Code 2012)<sup>2</sup>

### Newmont - Titanium Dioxide

At Newmont there is a current Inferred Mineral Resource of Titanium dioxide - 29 Mt of 5.01% TiO<sub>2</sub> and 942 ppm TREO (2% Ti cut-off)<sup>4</sup>.

A high titanium content in the REE mineralised saprolite (see Figures 1 and 2) occurs largely over amphibolite bedrock that contains ilmenite (FeTiO<sub>3</sub>). Mineralogy of the high titanium mineralisation

shows ilmenite to be the dominant titanium mineral with accessory amounts of rutile, anastase, pseudo rutile and leucoxene.<sup>9</sup>

Testwork indicates that titanium dioxide concentrate can be produced by magnetic separation of ilmenite. Further testwork is now being undertaken to confirm the mineralogy of the magnetic and non-magnetic Ti minerals as well as investigating the Ti recovery in a conventional mineral sands flowsheet incorporating gravity, magnetic and electrostatic separation techniques.

The Ti process rejects may be processed by flotation and acid leaching at moderate temperature (90 degC), impurity removal and solvent extraction to produce saleable concentrate products of oxides of REEs and scandium and possibly gallium.<sup>10</sup>

| Cut-off Ti % | Category     | Saprolite Zone | Mt        | Ti %        | TiO <sub>2</sub> % | TREO ppm   | Fe %       |
|--------------|--------------|----------------|-----------|-------------|--------------------|------------|------------|
| 2            | Inferred     | TREO >=600     | 20        | 3.11        | 5.18               | 1,183      | 8.9        |
|              | Inferred     | TREO <600      | 9         | 2.79        | 4.65               | 428        | 10.2       |
|              | <b>Total</b> |                | <b>29</b> | <b>3.00</b> | <b>5.01</b>        | <b>942</b> | <b>9.3</b> |

Table notes:

Saprolite 20 Mt >=600ppm TREO is contained within the current Newmont Mineral Resource estimate.

Saprolite 9 Mt <600ppm TREO is additional to the current Newmont MRE

The model is currently not reported within a constraining nominal pit shell of any sort. This might change in future reporting.

*Table 3: Newmont Deposit, Inferred TiO<sub>2</sub> Mineral Resource (JORC Code 2012)<sup>4</sup>*

## Newmont - Alumina/ HPA

Additionally, AMC has estimated a Mineral Resource JORC (2012) of 4 Mt of 29.6 % Al<sub>2</sub>O<sub>3</sub> (alumina) potentially upgradeable for HPA feedstock, also included within, and outside, the Newmont REE Mineral Resource.<sup>4</sup> HPA products are of high value and form an expanding speciality market.

| Cut-off Al (%) | Category     | Saprolite Zone | Mt       | Al %        | Al <sub>2</sub> O <sub>3</sub> % | TREO ppm   | Fe %        | Si %         |
|----------------|--------------|----------------|----------|-------------|----------------------------------|------------|-------------|--------------|
| 15             | Inferred     | TREO>=600      | 2        | 15.6        | 29.5                             | 909        | 4.22        | 20.08        |
|                | Inferred     | TREO<600       | 2        | 15.7        | 29.6                             | 276        | 2.84        | 22.59        |
|                | <b>Total</b> |                | <b>4</b> | <b>15.6</b> | <b>29.6</b>                      | <b>657</b> | <b>3.67</b> | <b>21.08</b> |

Table notes:

Saprolite 2 Mt >=600ppm TREO is contained within the current Newmont Mineral Resource estimate.

Saprolite 2 Mt <600ppm TREO is additional to the current Newmont MRE

The model is currently not reported within a constraining nominal pit shell of any sort. This might change in future reporting.

*Table 4: Newmont Deposit, Inferred Al<sub>2</sub>O<sub>3</sub> (alumina) Mineral Resource <sup>4</sup>*

<sup>9</sup> Roger Townend and Associates, Consulting Mineralogists, various reports 2013-14 to Salazar Gold Pty Ltd

## Material Information Used to Estimate the Mineral Resources for Scandium

The following summary is based on the requirements of *ASX Listing Rule 5.8.1* and presents a fair and balanced representation of the information contained within the full MRE report.

*Geology and geological interpretation:* The Newmont and O'Connor deposit areas are situated in the eastern part of the Proterozoic Albany-Fraser Orogen, east of the Biranup and Fraser Zones, straddling the Heywood-Newman Shear Zone and Nornalup Zone. The Newmont deposit is contained in saprolite which lies beneath 5 to 15 metres of Quaternary sediments and overlies Proterozoic granitic and amphibolite basement. The lithological interpretation of the main mineralised envelopes (saprolite unit) forms the basis for the modelling. The lithological envelope defines the prospective mineralised horizons, within which the resource estimation has been completed.

The infill drilling demonstrates the importance at Newmont of the underlying amphibolite as a major control on the formation and concentration of REE, titanium and scandium mineralisation. Deep historical RC and diamond drilling shows the bedrock amphibolite and adjoining felsic and intermediate gneiss to be mineralised with REEs, Ti and Sc in broad steeply dipping zones containing pegmatite dykes and quartz veining. This strong bedrock control to the overlying saprolite hosted mineralisation, which is reflected in the aeromagnetics, adds confidence to the interpreted continuity of REE, Ti and Sc mineralisation.

*Drilling techniques:* Conventional air core was drilled by several contractors between 2012 and 2023 with a standard blade or roller face sampling AC bit. Cyclone samples were taken every meter from air core drill holes that were normally stopped after encountering harder basement (saprock). The total cyclone sample was collected in a plastic RC bag. Samples for assay of around 1-2 kg were collected by mixing and scooping from the RC bag into a calico bag.

*Inferred Mineral Resource:* At Newmont, the drill spacing of vertical aircore holes within the scandium Inferred Resource scandium consists of east-west lines approximately 500 m apart, with hole spacing along the lines of 50 to 100 m. The Inferred Resource area also contains two northerly trending lines approximately 400 m apart with hole spacings of 100 m. The drill hole spacing, and sampling intervals were considered suitable for the scandium Inferred Mineral Resource estimation.

*Sample analysis method:* AC samples assayed by Bureau Veritas Minerals laboratory for rare earth elements and a selection of multi-elements using lithium borate fusion followed by rare earth and multi-element analysis for several elements including Al, Ti, Sc and Ga, with ICP-AES (Inductively coupled plasma atomic emission spectroscopy) or ICP-MS (Inductively coupled plasma mass spectrometry) analysis - dependent on element being assayed for and grade ranges.

*Estimation methodology:* Wireframes of the saprolite units were developed based on the section interpretation, using logged geological boundaries. Scandium grade estimation was completed by interpolation of composited sample data using inverse distance weighting (IDW) into a block model. The Mineral Resource was classed as Inferred based upon assessment and understanding of the deposit style, geological and grade continuity, and drillhole spacing.

*Cut-off grade:* The principal reported cut-off (75 ppm Sc) was reviewed against that reported from peer projects with similar clay or laterite associated mineralisation styles and mining and processing options.

*Mining methods:* It is assumed that the deposit could be mined by conventional open pit methods and that the overburden and mineralised saprolite will be 'free digging' without the need for explosives.

*Metallurgical methods and parameters:* Over the past eight years, Salazar Minerals has commissioned ANSTO, Nagrom, Amdel, CSIRO Hydrometallurgy<sup>11</sup> and TSW Analytical<sup>12</sup> to conduct several programs of REE metallurgical testwork on Newmont mineralised samples collected in aircore drilling.

The REEs, scandium and gallium are extractable by flotation and acid leaching at moderate temperature (90 degC), impurity removal and solvent extraction to produce potential saleable products of the oxides of REEs, scandium and gallium<sup>1</sup>. The historical leach tests show that Newmont scandium is readily leached at atmospheric pressures and whilst a range of temperatures and lixiviants have been tested, relatively low temperatures achieved good results. This historical testwork indicates that scandium at the Newmont deposit might be more amenable to extraction at much lower temperatures and pressures than typical lateritic deposits.

Metallurgical diagnostic and sighter leach tests were completed by Bureau Veritas Minerals (Amdel) and Nagrom.<sup>1,13,14</sup> A total of 165 diagnostic micro leaches were completed using SAC1 12-24 m as the test composite. The leach programs were initially established to assess REE and alumina leach characteristics, scandium was analysed at each stage as part of the total assay suite.

The range of parameters tested to identify the optimum leach conditions during these tests included lixiviants, leach times, pulp density, leach temperature with variations across all parameters.

The optimum conditions were determined to be:

- Lixiviant: 30% HCl
- Pulp Density: 20% solids
- Leach temperature: 95°C
- Pressure: Atmospheric
- Leach time: 24 hrs with no agitation

At the optimal leach conditions sample SAC1 12-24 m (-0.075 µm) yielded a total scandium recovery to solution of 81.2%.<sup>1</sup>

Scandium processing could form part of the overall Salazar Project process flowsheet (Figure 4) which would provide an integrated processing flowsheet recovering TiO<sub>2</sub>, REEs and scandium.

This testwork is currently being developed in conjunction with Nagrom and specialist mineralogy companies in Perth, WA.

This announcement has been prepared for publication in Australia and may not be released or distributed in the United States. This announcement does not constitute an offer to sell, or a solicitation of an offer to buy, securities in the United States or any other jurisdiction. Any securities described in this announcement have not been, and will not be, registered under the US Securities Act of 1933 and may not be offered or sold in the United States except in transactions exempt from, or not subject to, the registration of the US Securities Act and applicable US state securities laws.

#### Forward looking statement

Certain information in this document refers to the intentions of West Cobar, but these are not intended to be forecasts, forward looking statements or statements about the future matters for the purposes of the Corporations Act or any other applicable law. The occurrence of the events in the future are subject to risk, uncertainties and other actions that may cause West Cobar's actual results, performance or achievements to differ from those referred to in this document. Accordingly, West Cobar and its affiliates and their directors, officers, employees and agents do not give any assurance or guarantee that the occurrence of these events referred to in the document will actually occur as contemplated.

Statements contained in this document, including but not limited to those regarding the possible or assumed future costs, performance, dividends, returns, revenue, exchange rates, potential growth of West Cobar, industry growth or other projections and any estimated company earnings are or may be forward looking statements. Forward-looking statements can generally be identified by the use of words such as 'project', 'foresee', 'plan', 'expect', 'aim', 'intend', 'anticipate', 'believe', 'estimate', 'may', 'should', 'will' or similar expressions. These statements relate to future events and expectations and as such involve known and unknown risks and significant uncertainties, many of which are outside the control of West Cobar. Actual results, performance, actions and developments of West Cobar may differ materially from those expressed or implied by the forward-looking statements in this document.

Such forward-looking statements speak only as of the date of this document. There can be no assurance that actual outcomes will not differ materially from these statements. To the maximum extent permitted by law, West Cobar and any of its affiliates and their directors, officers, employees, agents, associates and advisers:

- disclaim any obligations or undertaking to release any updates or revisions to the information to reflect any change in expectations or assumptions;
- do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and
- disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

#### Competent Person Statement and JORC Information

The Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the 'JORC Code') sets out minimum standards, recommendations and guidelines for Public Reporting in Australasia of Exploration Results, Mineral Resources and Ore Reserves.

The Information contained in this announcement is an accurate representation of the available data and studies for the Cobar West Projects and Salazar Project.

The information contained in this announcement that relates to the exploration information, geological logging, and geological interpretation of scandium mineralisation at the Salazar REE Project WA is based, and fairly reflects, information compiled by Mr David Pascoe, who is Head of Technical and Exploration for West Cobar Metals Limited and a Member of the Australian Institute of Geoscientists. Mr Pascoe has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Pascoe consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

The information contained in this announcement that relates to the metallurgical information at the Salazar REE Project WA is based, and fairly reflects, information compiled by Mr Aaron Debono, who is a full-time employee of NeoMet Engineering acting for West Cobar Metals Limited and a Fellow of the Australasian Institute of Mining and Metallurgy. Mr Debono has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Debono consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

The Mineral Resource estimate was prepared, and fairly reflects information compiled, by Mr Serik Urbisnov, who has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the

activity which he is undertaking to qualify as Competent Persons as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the JORC Code). Mr Urbisnov is a full-time employee of AMC Consultants and a Member of the Australian Institute of Geoscientists. Mr Urbisnov consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria              | JORC Code explanation   | Commentary   |
|-----------------------|---|--|
| Sampling techniques   | <ul style="list-style-type: none"> <li>• <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li>• <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li>• <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li>• <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul> | <ul style="list-style-type: none"> <li>• For the December 2022 to January 2023 Phase 1 drill program, samples were taken every drilled meter from an air core (AC) drill rig with sample cyclone. The cyclone sample in total was collected in a plastic RC bag. Samples for assay are around 1kg taken from every 1m AC drill interval collected by mixing and scooping from the RC bag into a calico bag. Entire 1kg sample was pulverized in the laboratory to produce a small charge for lithium borate fusion/ICP assay.</li> <li>• Sampling was supervised by experienced geologist. A blank sample and duplicate sample was inserted for every hole. The laboratory also inserted QAQC samples, including Certified Reference Material (CRM) (see Quality of assay data and laboratory tests).</li> <li>• Historical (SAC series drill holes) sampling techniques are described in West Cobar’s ASX announcement of 8 September 2022</li> </ul> |
| Drilling techniques   | <ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>  | <ul style="list-style-type: none"> <li>• Drill type was air core, drilled by Drillpower. using blade and hammer industry standard drilling techniques.</li> <li>• Drilling used blade bits of 87 mm with 3 m length drill rods to blade refusal, or bedrock chips obtained.</li> <li>• Historical (SAC series drill holes) drilling techniques are described in West Cobar’s ASX announcement of 8 September 2022</li> </ul>   |
| Drill sample recovery | <ul style="list-style-type: none"> <li>• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li>• <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain</i></li> </ul>  | <ul style="list-style-type: none"> <li>• Sample quality and recovery were recorded in comments on log and sample sheets. The sample data was entered into an Excel sample log sheet.</li> <li>• Sample recovery was of a high standard and little additional measures were required.</li> </ul>  |

| Criteria  | JORC Code explanation  | Commentary   |
|---|--|--|
|   | <i>of fine/coarse material.</i>  | <ul style="list-style-type: none"> <li>Holes were drilled 100 m apart close to the area of and within the Newmont Inferred Resource.</li> <li>Holes were drilled 200 m to 400 m apart to explore E63/1496 and E63/1469</li> <li>The assays, were compared against historical data and no indications of sampling or analytical bias were obtained</li> </ul>   |
| <i>Logging</i>  | <ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>  | <ul style="list-style-type: none"> <li>Every 1 m interval of the material drilled was geologically examined and logged (colour, grain size, quartz content, clay content and type) and intervals of similar geology grouped and zones of transported and in-situ regolith identified (soil, calcrete, transported clay, transported sand, upper and lower saprolite types, saprock).</li> <li>All intervals, including end of hole 'fresh' basement chips saved in chip trays and photographed.</li> <li>Basement chips geologically logged (geology, structure, alteration, veining and mineralisation).</li> </ul> |
| <i>Sub-sampling techniques and sample preparation</i> | <ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul> | <ul style="list-style-type: none"> <li>No drill core.</li> <li>AC drill samples mostly dry clayey powders with varying quartz grain content and rare chips, collected from AC sample cyclone complete, every meter, into plastic RC bags weighing 8-12 kg. Sub-samples for assay (1-2 kg) collected by hand every 1m by mixing RC bag contents and scooping into a calico bag.</li> <li>Samples mostly dry, with damp or wet intervals recorded.</li> <li>The sample type and method were of an appropriate standard for AC drilling.</li> <li>A blank and duplicate were inserted in the sample stream.</li> </ul>  |
| <i>Quality of assay data and laboratory tests</i>     | <ul style="list-style-type: none"> <li><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations</i></li> </ul>  | <ul style="list-style-type: none"> <li>AC samples assayed by Bureau Veritas Minerals laboratory for rare earth elements and a selection of multi-elements using lithium borate fusion followed by rare earth and multi-element analysis with ICP-AES (Inductively coupled plasma atomic emission spectroscopy) or ICP-MS (Inductively coupled plasma mass spectrometry)</li> </ul>   |

| Criteria                                     | JORC Code explanation   | Commentary   |         |       |       |           |                                |       |        |                  |       |              |                                 |       |           |                                |       |          |                                |       |          |                                |       |            |                                |       |         |                                |       |            |                                |       |         |                                |       |        |                                |       |         |                                |       |           |                                |       |          |                                |       |         |                               |       |
|--|---|--|---------|-------|-------|-----------|--------------------------------|-------|--------|------------------|-------|--------------|---------------------------------|-------|-----------|--------------------------------|-------|----------|--------------------------------|-------|----------|--------------------------------|-------|------------|--------------------------------|-------|---------|--------------------------------|-------|------------|--------------------------------|-------|---------|--------------------------------|-------|--------|--------------------------------|-------|---------|--------------------------------|-------|-----------|--------------------------------|-------|----------|--------------------------------|-------|---------|-------------------------------|-------|
|  | <p><i>factors applied and their derivation, etc.</i></p> <ul style="list-style-type: none"> <li>• <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></li> </ul>  | <p>analysis - dependent on element being assayed for and grade ranges. The fusion techniques are considered total assays of non-refractory and refractory minerals, with lithium borate fusion assay most suitable for rare earth elements.</p> <ul style="list-style-type: none"> <li>• Bureau Veritas maintains an ISO9001.2000 quality system.</li> <li>• Historical (SAC series drill holes) quality of assay data and laboratory testing are described in West Cobar's ASX announcement of 8 September 2022</li> </ul>  |         |       |       |           |                                |       |        |                  |       |              |                                 |       |           |                                |       |          |                                |       |          |                                |       |            |                                |       |         |                                |       |            |                                |       |         |                                |       |        |                                |       |         |                                |       |           |                                |       |          |                                |       |         |                               |       |
| <p>Verification of sampling and assaying</p> | <ul style="list-style-type: none"> <li>• <i>The verification of significant intersections by either independent or alternative company personnel.</i></li> <li>• <i>The use of twinned holes.</i></li> <li>• <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></li> <li>• <i>Discuss any adjustment to assay data.</i></li> </ul> | <ul style="list-style-type: none"> <li>• Sample intersections were checked by the geologist-in-charge.</li> <li>• 3 pairs of twinned holes employed to assess data reliability</li> <li>• Data entry onto log sheets then transferred into computer Excel files carried out by field personnel thus minimising transcription or other errors. Careful field documentation procedures and rigorous database validation ensure that field and assay data are merged accurately. ### Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

| Criteria                         | JORC Code explanation   | Commentary  |
|----------------------------------|---|---|
| <i>Database integrity</i>        | <ul style="list-style-type: none"> <li>• <i>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</i></li> <li>• <i>Data validation procedures used.</i></li> </ul> | <ul style="list-style-type: none"> <li>• Data used in the Mineral Resource estimate (MRE) is sourced from a database provided in the form of Microsoft Excel files. Relevant tables from the files are imported into Micromine 2023 software for use in the MRE. These were validated in Micromine for inconsistencies, overlapping intervals, out of range values, and other important items.</li> <li>• All data was visually checked.</li> </ul> |
| <i>Site visits</i>               | <ul style="list-style-type: none"> <li>• <i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i></li> <li>• <i>If no site visits have been undertaken indicate why this is the case.</i></li> </ul>   | <ul style="list-style-type: none"> <li>• Dr. Andrew Scogings of AMC Consultants visited site during drilling 24 / 25 February 2015. Observed drilling, logging, sampling, QC samples, sample packaging in bulka bags, samples dispatched.</li> </ul>  |
| <i>Geological interpretation</i> | <ul style="list-style-type: none"> <li>• <i>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</i></li> <li>• <i>Nature of the data used and of any</i></li> </ul>   | <ul style="list-style-type: none"> <li>• The Newmont and O'Connor areas are situated in the eastern part of the Proterozoic Albany-Fraser Orogen, east of the Biranup and</li> </ul>  |

| Criteria                 | JORC Code explanation  | Commentary   |
|--------------------------|--|--|
|                          | <p><i>assumptions made.</i></p> <ul style="list-style-type: none"> <li>● <i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i></li> <li>● <i>The use of geology in guiding and controlling Mineral Resource estimation.</i></li> <li>● <i>The factors affecting continuity both of grade and geology.</i></li> </ul> | <p>Fraser Zones, straddling the Heywood-Newman Shear Zone and Nornalup Zone. The Newmont deposit is contained in saprolite and saprock which lies beneath 5 to 15 m of Quaternary sediments and overlies Proterozoic granite and amphibolite basement. The lithological interpretation of the main mineralised envelopes (saprolite unit) forms the basis for the modelling. The lithological envelope defines the prospective mineralised horizons, within which the resource estimation has been completed.</p> <ul style="list-style-type: none"> <li>● The infill drilling demonstrates the importance at Newmont of the underlying amphibolite as a major control on the formation and concentration of REE, titanium dioxide and scandium mineralisation. Deep historical RC and diamond drilling shows the amphibolite and adjoining felsic and intermediate gneiss to be mineralised with REEs, titanium dioxide and scandium in broad vertical zones. These zones contain pegmatite dykes and quartz veining, and it is concluded that the control on the REEs, titanium dioxide and scandium is related to the amphibolite host rocks and shears in the vicinity of gneiss/amphibolite contacts within a zone of particularly tight folding. The strong bedrock control, which is reflected in the aeromagnetics, adds confidence to the interpreted continuity of REE mineralisation.</li> <li>● At O'Connor, REE mineralised saprolite is developed from granite and granitic gneiss bedrock, which is locally enriched in REE's. The thicker saprolite is apparent in VTEM images.</li> </ul> |
| <p><i>Dimensions</i></p> | <ul style="list-style-type: none"> <li>● <i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</i></li> </ul>  | <ul style="list-style-type: none"> <li>● The currently interpreted saprolite unit of the Newmont area extends for approximately 6.6 km along a south-north direction and up to 3.4 km along a west-east direction. From surface in places to approximately 50m depth.</li> <li>● 6.6 km for the O'Connor along a</li> </ul>  |
