Corporate

- Strong balance sheet with \$17.2 million cash on hand at the end of the quarter.

Diversified minerals development company Anson Resources Limited (ASX: ASN) (Anson, the Company) is pleased to provide the following update on its activities for the period ended 31 March 2024.

Anson has a portfolio of minerals projects in demand-driven commodities, led by its core lithium assets in the Paradox Basin in Utah, USA. It is focused on developing the project into a significant lithium producing operation.

Paradox Lithium Project, Utah

During the quarter, Anson announced the completion of the geotechnical engineering study at the Paradox Lithium project. This engineering study formed a key component of the due diligence process undertaken to confirm the suitability for the location of the proposed Direct Lithium extraction (DLE) processing plant at the Paradox Lithium Project.

The study has delivered a successful outcome and has confirmed that the site is suitable for the construction of the foundations for the proposed processing plant. It recommended that prior to the laying of foundations, general site grading be carried out to provide proper support for foundations, exterior concrete flatwork, and concrete slabs-on-grade.

Green River Lithium Project, Utah

During the quarter, Anson commenced its JORC Mineral Resource drilling program at the Green River Lithium Project in the Paradox Basin, in south-eastern Utah, USA.

The drilling program is the first stage of Resource definition drilling at Green River and was undertaken on the Company's recently acquired industrial-use land, which is now privately owned by Anson, *see ASX announcement dated 13 September 2023*.

The well, Bositydaba #1 (Figure 1), was planned to be drilled to a total vertical depth of 10,800 feet (3,292 meters). This target depth was exceeded as it was determined that the thickness of the both the Clastic Zones and the Leadville, Mississippian Units were thicker than expected. Drilling depth reached a vertical depth of 11,210 feet (3,417m), *see ASX Announcement 22 April, 2024*. The Bositydaba#1 well is located adjacent to the Company's recently commissioned Sample Demonstration Plant (SDP) and the on-site Visitor Centre.

Figure 1: The drill rig setup at the Bositydaba #1 well site with the Utah Sample Demonstration Plant in the background

Drilling targeted both the Clastic Zones and the Mississippian Units that contain previously recorded supersaturated brines.

Drilling the first 1,500 foot interval, slightly saline aquifers were intersected, which was expected and measures that had been agreed with Utah Division of Oil & Gas (UDOGM) to control the water flow, were implemented. The water from this flow was collected and disposed of in according to the plan. These waters had a low chloride assay of 1,800ppm. This compares to the chloride values from the lithium rich brines to be extracted for processing of 350,000ppm. These very low chloride values demonstrate that there is **no interconnectivity** between the shallow aquifers and the deep Pennsylvanian Clastic zone brines, *see ASX announcement dated 12 March 2024*.

In the Clastic Zones intersected in the Bosydaba #1 well consist of dolomite, black shale, sandstone and anhydrite, showing the same lithological units as those that are logged at the Paradox Lithium Project, *see ASX announcement dated 4 April 2024*. If the Clastic Zones are thick, this provides another technique to identify them along with the downhole geophysical logs. The Clastic Zones intersected retain the same lithological units at the Paradox project 50km to the south-east of the Green River Lithium Project indicating that the Clastic horizons are continuous between the two projects.

The priority targets are the saline aquifers of the highly porous Clastic horizons of the Pennsylvanian Formation and the Mississippian Units. The Pennsylvanian Formation consists of 29 separate evaporite cycles.

It has previously been recorded that both the Clastic Zones and the Mississippian Units contain supersaturated brines, but no assaying for lithium has been carried out. Anson's drilling through these zones of supersaturated brines, and sampling of the horizons that host the brines, will allow the brines to be collected.

With the completion of the well, it is expected that brine will be able to flow directly to the Sample Demonstration Plant which consists of both the Direct Lithium Extraction (DLE) and the downstream purification process. This will result in the plant being capable of operating 24/7 and producing a high purity lithium carbonate product.

Anson plans to use the resulting data, such as specific yield, to delineate a JORC Mineral Resource at the Green River Project.

The Ajana Project

The Ajana Project is near Northampton, Western Australia, a proven and established mining province for zinc, lead, and silver. The Project is adjacent to the North West Coastal Highway and 130km north of Geraldton. Historical exploration in the area has concentrated on the search for lead and zinc deposits. The prospective ground on the tenements E66/89 and E66/94 is dominated by the Northampton Metamorphic Complex.

The Ajana Project contains several historic copper, lead and silver producing mines that

date back to 1850.

Drilling at Ajana comprised a 30 hole-1,105 metre reverse circulation (RC) program targeting highly prospective lead (Pb)-zinc (Zn)-copper (Cu)-silver (Ag) mineralised areas at the priority Surprise and Ethel Maude prospects at the Ajana Project.

These drill targets were identified via previous VTEM geophysical survey (*ASX announcement 13 November 2017*), and interpreted anomalies from historical soil sampling programs and previous geological mapping programs.

The program has successfully intersected multiple high-grade zones at both targets, which have validated Anson's exploration approach at the Project, *see ASX announcement dated 19 February 2024*.

A summary of the highlight drill intersections is shown in Table 1 and Figure 2.

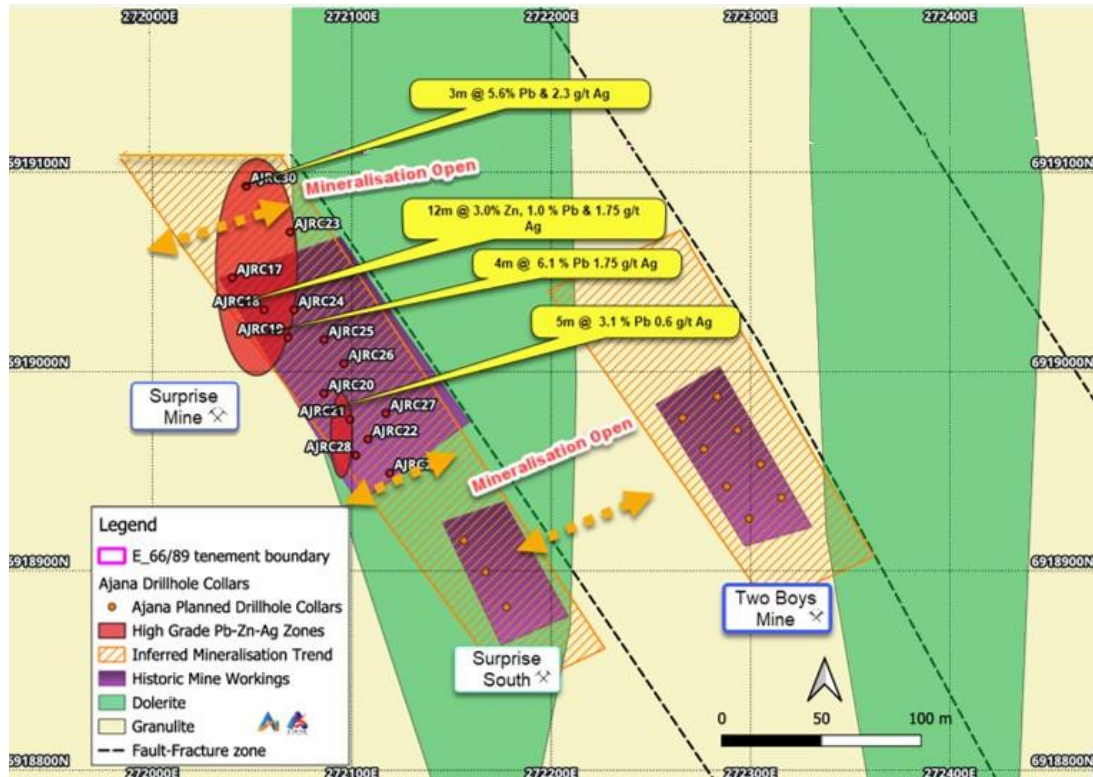

Figure 2: Geological interpretation of the Galena-Surprise Prospect showing high grade Pb-Zn-Ag-Cu target zones

Based on the success of the first phase of drilling, a second phase of drilling was designed to further test the extents of mineralisation around the historic Ethel Maude mine and follow the potential Zn-Pb-Ag mineralisation trend to the north, south and east of the workings.

The latest drilling results offer further exciting potential for future development of the mineralised zone extending along strike and at depth underneath the current workings (Figure 3) (ASX announcement 26 March 2024).

Hooley Well Cobalt-Nickel Laterite Project

The Hooley Well Nickel-Cobalt Laterite Project is located 800km north of Perth and 300km north-east of Geraldton in Western Australia consisting of three tenements E9/2218, E9/2219 and E9/2462. Tenements E9/2218 and E9/2219 contain historical shallow drilling which has intersected nickel and cobalt laterites. There are also possible primary nickel sulphides (identified by IP response) at depth.

During the quarter, Anson received positive assay results from its recently completed first-pass sampling program at the Hooley Well Project, *see ASX announcement dated 26 February 2024*.

The sampling program comprised a total of 46 rock chip and 356 soil samples collected across priority targets at Hooley Well and was designed to map and identify potential for nickel (Ni)-chrome (Cr)-cobalt (Co) and platinum group element (PGE) laterites, as well as explore for Rare Earth Element (REE) targets within clay zones.

Highlight results from the rock chip sampling and soil sampling at the Hooley Well Project are provided in Table 3.

Table 3: Recently collected anomalous rock chip and soil sample assays from Hooley Well Prospect

Limited exploration has been carried out on the Hooley Well project area, which is largely covered by colluvium. Given the successful outcomes of the first-pass sampling program, Anson plans to undertake the following field work in order to further advance the Project:

- Shallow RC drilling to target high priority targets identified from surface assay results proximal to Erong Hill;
- Further systematic RC drilling in areas exhibiting strong magnetic responses and IP resistivity proximal to fracture or fault margins along the Yilgarn Craton, designed to target an economic Ni-Cr laterite oxide-style deposit;
- Detailed geological and structural mapping of RC drilling assay results will lead to infill RC and later deep sourced diamond drilling of highly mineralised nickel laterite or nickel sulphide target areas (subject to results); and
- Shallow reconnaissance air core (AC) drilling to target the REE anomalies close to surface.

Yellow Cat Vanadium / Uranium Project

The Yellow Cat project is located 30 km north of Moab, in the Thompson District, Grand County Utah. There are two separate areas: the Yellow Cat and the Yellow Cat West claims.

Post the end of the quarter, Anson has completed the environmental and cultural surveys required to submit a Notice of Intent (NOI) to both the Utah Division of Oil, Gas & Mining (UDOGM) Minerals Division and the USA Federal Government, Bureau of Land Management (BLM) to drill and sample the high-grade uranium and vanadium rich mineralised zones at the Yellow Cat Project. Anson plans to commence the drilling program following the receipt of the regulatory government approvals.

Anson has proposed to drill 27 exploratory holes in the Yellow Cat/Poison Strip area. The drill pads will measure ten feet in length by three feet in width. Most of the exploratory areas are next to existing access routes.

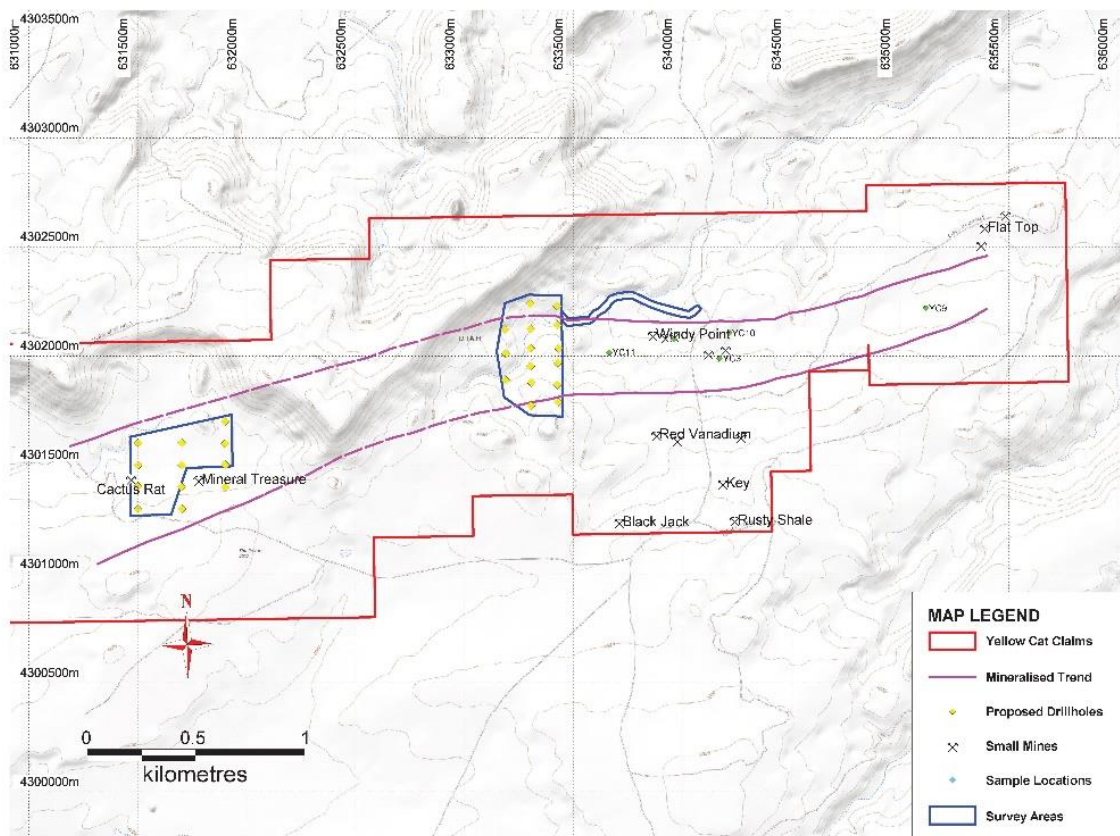

Figure 4: Plan showing the proposed exploration program and surveyed area within the mineralised trend at the Yellow Cat Bull Nickel-Copper-PGE Project

The Bull Project is located only 35km from Perth abutting Chalice Mining Limited’s (Chalice) (ASX: CHN) tenements and is 20km south-west along strike of Chalice’s high-grade Julimar Ni- Cu-PGE discovery. Anson is still awaiting the granting of ELA0/5619 tenement that abuts the Bull Project area to the south.

Negotiations continued with the landowners in which drilling exploration programs are planned with staff confirming the location of the drill holes that would result in the least amount of disturbance possible. Priority drill targets were defined based on geophysical surveys and geological mapping. The stage 1 drilling program consists of 18 holes focusing on priority areas 1, 2 and 3, and will be drilled to a depth of 200m from west to east at a 60° angle to maximize potential intersection of the targeted anomalous ultramafic units, see Figure 5.

The magnetic image interpretation in Figure 5 shows the distinct internal character of the magnetic anomaly at The Bull. Rather than a homogenous ovoid-shaped magnetic anomaly, the anomaly appears to be comprised of a series of magnetic high lenses and potential structural offsets.
