

ERRAWARRA IDENTIFIES LARGE STACKED PEGMATITE SWARM AT ANDOVER WEST PROJECT

HIGHLIGHTS:

- Errawarra identifies large (~ 1.6km x 1km) stacked pegmatite swarm at Andover West
- Highly anomalous Li Soil trend (peak 325ppm Li₂O) highlighted
- Stacked, low angle, north dipping pegmatite packages mapped
- Second strong anomalous Li soil trend (peak 299ppm Li₂O) Li soil trend also highlighted in NW area
- Anomalous lithium soil trends are along strike and 1.7km from Raiden's lithium pegmatite discovery that reported 3.8% Li₂O rock chip
- Fertility of pegmatite swarm highlighted by extensive background Li soil anomalism (>100ppm Li₂O)
- Andover Heritage Clearance Survey scheduled to be undertaken in May
- Planning for a drill program is underway
- Field teams mobilised to the Pinderi Hills JV with sampling underway

Errawarra Resources Ltd (ASX:ERW) (**Errawarra** or the **Company**) is pleased to provide this update to market on exploration at the Andover West project in the West Pilbara region.

Andover West Project comprises over 100km² of prospective ground located approximately 40km east-southeast of Karratha and south of Azure's Andover LCT Pegmatite project (now owned by SQM/Hancock¹), with an exploration target of 100-240mt @ 1-1.5% Li₂O².

Executive Chairman Thomas Reddicliffe commented:

"We are excited not only by the recognition of this large pegmatite swarm which lies adjacent to Azure minerals Andover project but also because we can now focus in on the lithium fertile zones within these broad pegmatite packages. We believe that we may have only hit the tip of the iceberg with these lithium fertile zones within the pegmatite packages and with their shallow dips we have the opportunity to explore for higher grades down dip. Being along strike and in proximity to the Raiden lithium pegmatites we are optimistic of our chances and keen to do some exploratory drilling.

¹ Refer Azure Minerals Ltd ASX announcement dated 2 May 2024.

² Refer Azure Minerals Ltd ASX announcement dated 7 August 2023.

As can be seen from various other discoveries such as by TG Metals and Nimy Resources, elevated soil anomalies can point towards lithium bearing pegmatites under cover and potentially larger lithium pegmatites sub-surface. We aim to complete our ground reconnaissance and mapping as quickly as possible to enable drilling of selected targets. With our heritage clearances scheduled to be completed this month we could see ourselves drilling this quarter.”

ANDOVER WEST LITHIUM PROJECT

Mapping

Detailed mapping is continuing in the northwest area and also at the eastern Li pegmatite discovery where there is good exposure of the pegmatites around the margins of the Andover Mafic Intrusion. In both areas there are numerous stacked east-west striking pegmatites which dip to the north at approximately 30 deg and less. These two areas are approximately 4km apart and appear related inferring that the packages likely transect the intervening tenure where Raiden has reported Li pegmatites and assay values including 3.8% Li₂O from rock chip samples. The extensive occurrence of pegmatites particularly in the northwestern area is shown in Figure 2 with the main swarm having an area of ~1.6km x 1km.

Reconnaissance Soil Sampling

Reconnaissance soil sampling was completed in the northwest portion of the tenement to follow-up on the high frequency of lithium anomalous pegmatites that occur in this area. A total of 148 samples were collected on a 100m x 400m grid. Soil sampling had not been previously done in this area due to a relatively high abundance of outcrop including pegmatites that can be sampled directly. The Lithium fertile nature of the pegmatites in this area was previously highlighted in rock chip samples which reported a peak value of 928ppm Li₂O.

Two strongly anomalous Li soil trends have been highlighted in this NW portion of the tenement. The strongest trend is located within the pegmatite swarm and reported a peak Li₂O value of 325ppm. This trend appears to be along strike of the Raiden pegmatites where Li₂O values including 3.8% were reported from rock chips. Also, along strike and further to the east is the Li pegmatite discovered by Errawarra which reported a peak rock chip assay of 0.9% Li₂O. An additional second strong anomalous (Peak 299ppm Li₂O) Li trend also highlighted in the northern section of the NW area.

These associated soil and rock chip sample results are very encouraging and point to Li fertile pegmatites within the stacked pegmatite packages.

Follow Up Soil Sampling

The Company has previously reported the results of 531 reconnaissance soil samples which were taken to investigate the potential for LCT Pegmatites to the south of the mapped extent of the Andover Mafic Intrusion. This sampling highlighted 3 zones³ considered prospective for the occurrence of Li Pegmatites based on soil assays which reported up to 424ppm Li₂O.

The new follow-up soil sampling was focused in the 3 previously highlighted anomalous Li Soil zones with a total 1070 samples taken on a 50m x 100m grid. The results of this sampling further constrained the anomalous zones.

Heritage Clearance Survey

Heritage Clearance surveys are scheduled to be completed this month over selected portions of the anomalous Li zones and including the stacked pegmatite packages mapped in both the northwest and in the east. This will clear the way to undertake planning for future drill programs.

Follow Up Soil Sampling

Mapping and prospecting will continue in the target areas identified from the soil sampling to enable the finalising of areas to be drill tested. Of particular interest are the Li anomalous zones within the pegmatite packages which may be associated with higher grades down dip.

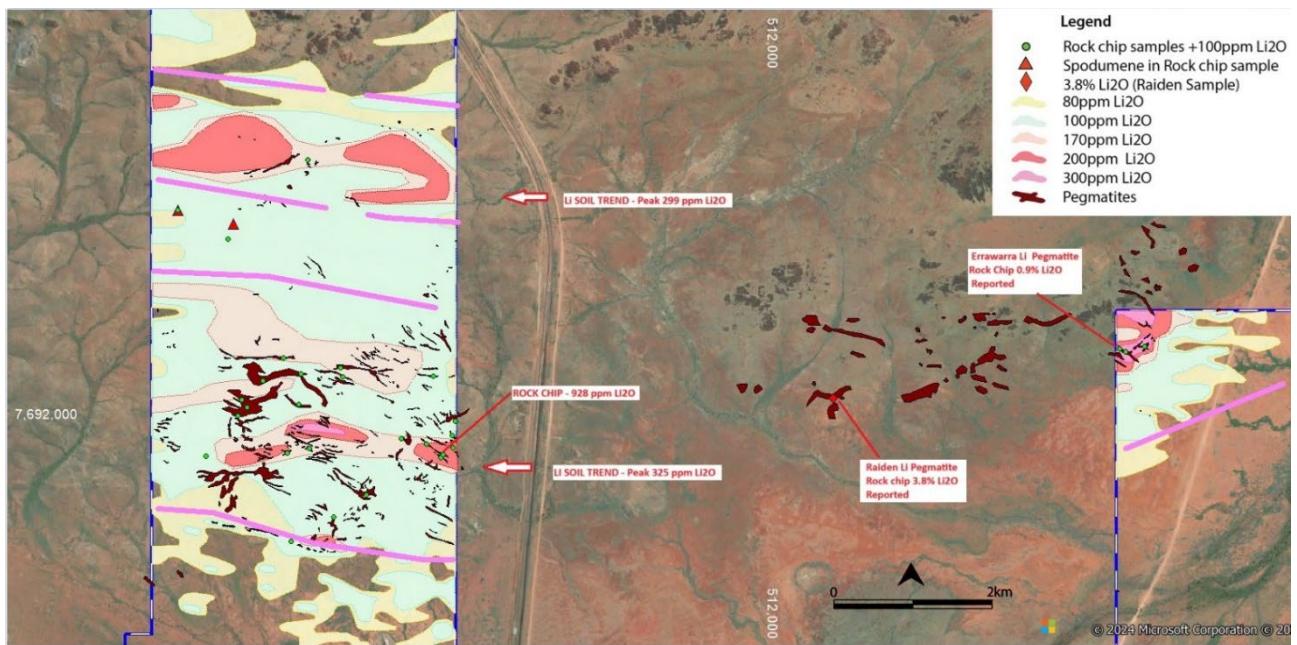

Figure 3. Interpreted Soil Sample Results

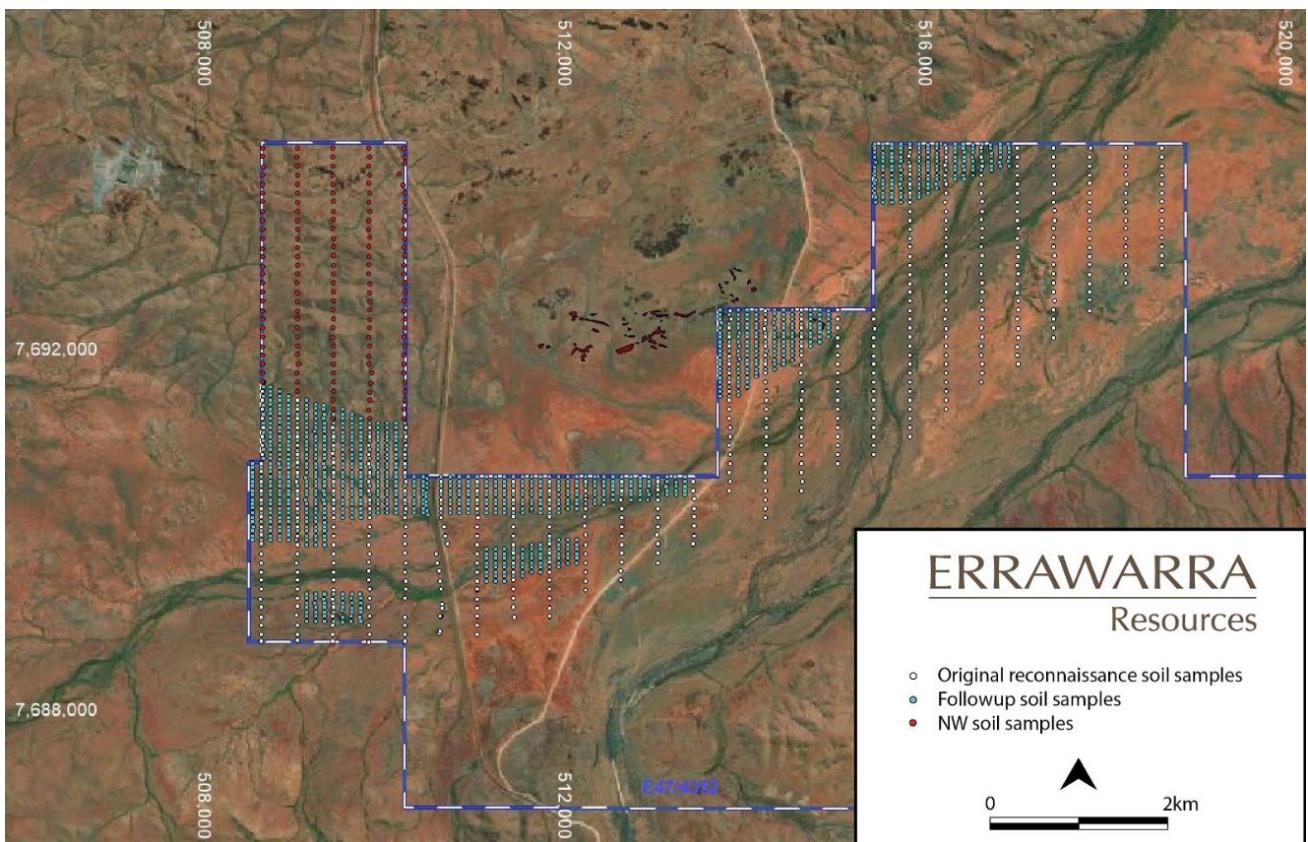

Figure 4. Location of New Follow-up and Reconnaissance Soil Samples

PINDERI HILLS JV LITHIUM PROJECT

On the 29 April 2024, Errawarra announced that it had entered into a joint venture with Alien Metals (AIM: UFO) in respect of lithium rights on the Pinderi Hills Project located in the West Pilbara.

Lithium Caesium Tantalum (LCT) pegmatite target areas have been identified in greenstone mafic-ultramafic rocks within the Alien tenements near “hot” granites which are reported to belong to the Orpheus suite of rocks. These same granites are associated with lithium pegmatite emplacement in the significantly mineralised lithium pegmatite corridor located some 20km to the north.

A large number of geomorphic features were identified in the Maitland Intrusive Complex which are interpreted as possible pegmatite dyke swarms. These interpreted pegmatite dykes are shown in more detail in Figure 5 and appear comparable to the recently discovered LCT pegmatites within the Andover Intrusive Complex located 35km to the north-east.

Exploration teams have been mobilised to the project area to commence the initial reconnaissance exploration. Results will be reported when they are received.

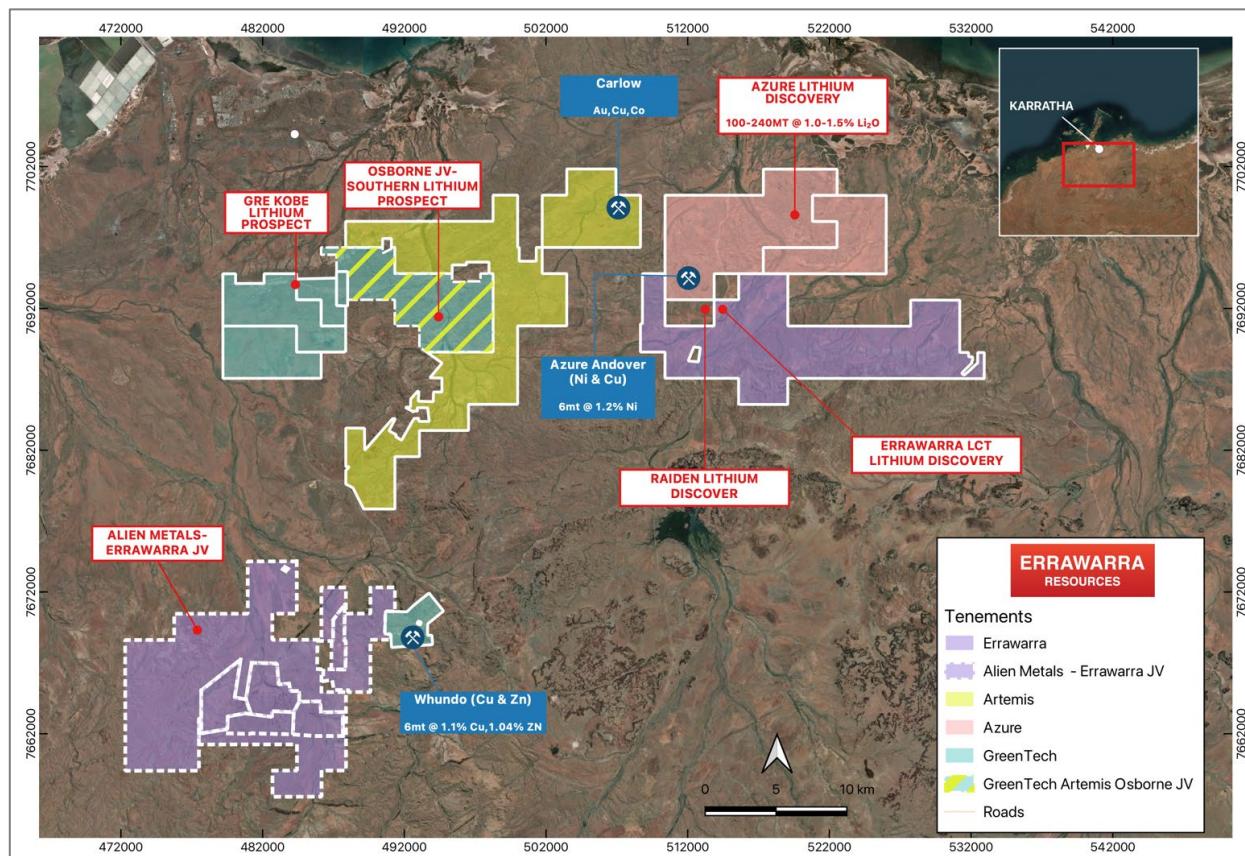

Figure 5. Errawarra and the new Alien Metals joint venture area in the West Pilbara Lithium Province

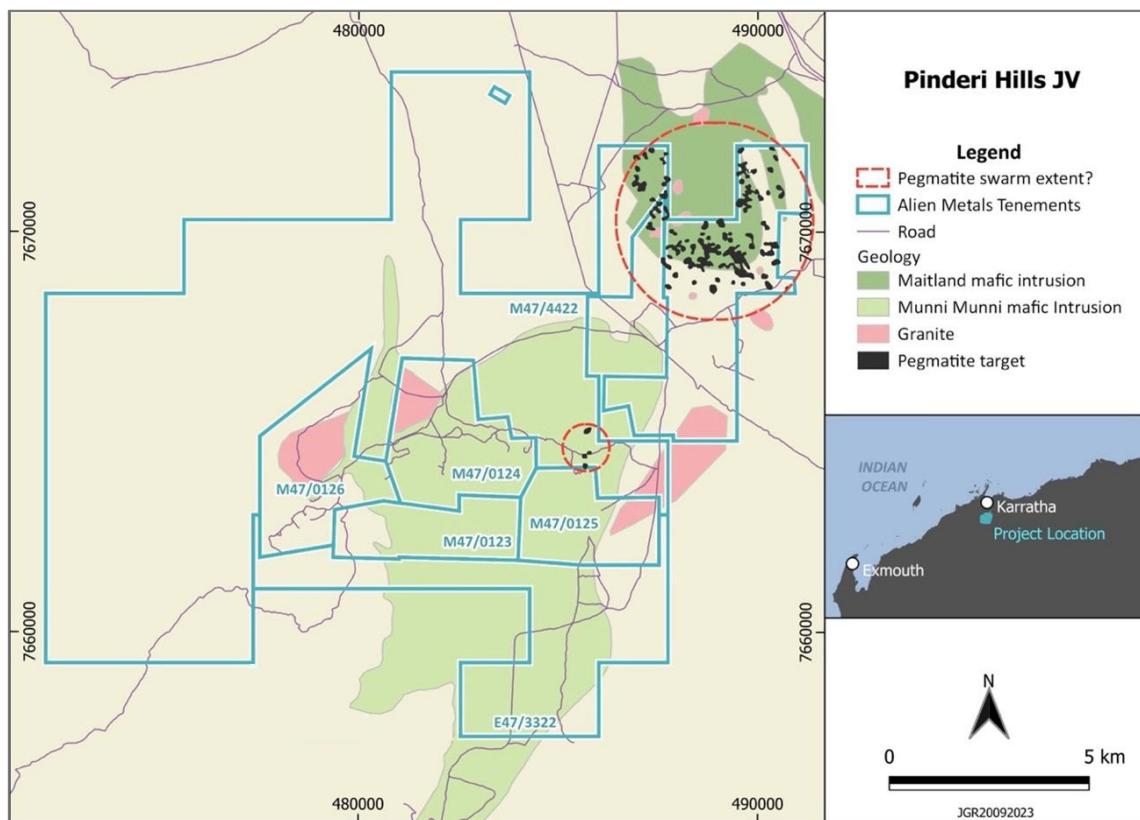

Figure 6. Pinderi Hills pegmatite swarm extent noted to date

The Company is looking forward to the results of our ongoing ground work at both Andover and Pinderi Hills as well as the completion of the scheduled Heritage survey clearances and will keep the market updated accordingly.

This ASX announcement has been authorised for release by Thomas Reddicliffe, Executive Chairman on behalf of the Board of Directors.

JORC CODE, 2012 EDITION – TABLE 1 REPORT

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<ul style="list-style-type: none"> Reconnaissance style rock chip sampling taken opportunistically from pegmatite outcrop. This announcement discusses the findings of reconnaissance and follow-up sampling and mapping with a view to determining the lithium potential of the Company's tenements and which included the collection of rock chip samples. Pegmatite was identified in outcrop. The rock chip samples were restricted to outcrop of pegmatite rocks. Samples were dispatched to ALS Global Laboratories in Perth for analysis. Soil samples were collected on a 100m x 400m NS orientated grid and with follow-up samples taken on a 50m x 100m grid.. Samples were taken from a depth of 20cm and sieved to collect the - 1mm size fraction The samples were sent to ALS Global laboratories in Perth to undergo a 4 acid digest using their ME-MS61L 60 element technique
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> This announcement does not relate to drilling carried out by Errawarra Resources Ltd. No mention is made in this announcement of exploration drill results including drilling conducted by other companies on nearby tenements.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<ul style="list-style-type: none"> Not applicable as no details on any drilling carried out by Errawarra Resources are included in this announcement.
<i>Logging</i>	<ul style="list-style-type: none"> <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate</i> 	<ul style="list-style-type: none"> Not applicable due to the reconnaissance nature of the sampling.

Criteria	JORC Code explanation	Commentary
	<p><i>Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <ul style="list-style-type: none"> • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the insitu material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> • Rock chip samples were dispatched to ALS Global Laboratories in Perth for analysis using their GE_IMS92A50 46 element technique. • The laboratory reported the use of standards and blanks as part of the analyses for QA/QC. • The samples were opportunistic in nature and taken from insitu outcrop. • Samples were approximately 0.5kg to 1kg in weight. • The samples were considered generally representative of the outcrop being sampled.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> • Rock chip samples were dispatched to ALS Global Laboratories in Perth for analysis using their GE_IMS92A50 46 element technique. • The laboratory reported the use of standards and blanks as part of the analyses for QA/QC. • No standards or blanks were submitted by the company. • Soil samples were dispatched to ALS Global Laboratories in Perth for analysis using their ME-MS61L 60 element technique. • The laboratory reported the use of standards and blanks as part of the analyses for QA/QC. • No standards or blanks were submitted by the company
Verification of sampling and assaying	<ul style="list-style-type: none"> • The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> • No verification of sample results for rock chips or soil samples has been undertaken.
Location of data points	<ul style="list-style-type: none"> • Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. 	<ul style="list-style-type: none"> • Sample points were determined by hand held GPS which is considered appropriate for the reconnaissance nature of the sampling.

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	<ul style="list-style-type: none"> <i>Quality and adequacy of topographic control.</i> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> Not applicable due to the reconnaissance nature of the sampling. No attempt has been made to demonstrate geological or grade continuity between sample points. Soil samples were collected on a 100m x 400m NS orientated grid
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> Not applicable
Sample security	<ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> Sample security is by way of chain of custody.
Audits or reviews	<ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> No review of the sampling techniques has been undertaken.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> The Andover West project tenement covers an area of 100km² and comprises granted tenement 47/4352. The tenement is owned 100% by Western Exploration subsidiary company owned 80% by Errawarra Resources Ltd The tenements are in good standing with DMIRS and there are no known impediments for exploration on these tenements.
Exploration done by other parties	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> Numerous exploration parties have held the area covered by the current Errawarra tenure previously. There is no reported previous exploration for lithium bearing pegmatites on the tenement. No other exploration companies generated data was used in this release. Regional RTP aeromagnetics and geology from Geological Survey of WA.

Criteria	JORC Code explanation	Commentary
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The pegmatite zone trends WNW-ESE and is mostly hosted by the Andover Mafic Intrusion. The pegmatites mostly occur as intermittent deformed lenses in the Andover Mafic Intrusion. The pegmatites are moderately dipping and up to 5m wide. The project area is underlain by the Archean Pilbara Craton, specifically the West Pilbara Superterrane (WPST) of Hickman (2016). The 3280-3070 Ma WPST comprises numerous tectonostratigraphic packages (Sholl, Regal and Karratha Terranes and the Whundo and Nickol River Basins) and igneous complexes that have been variously affected by several tectonic events. The easterly to east-north easterly trending Sholl Shear Zone (SSZ) is a boundary for the regional rock packages. Metamorphic grade is higher to the north of the SSZ, suggesting the present-day surface shows a slightly deeper crustal level on the north side.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> Not applicable as drilling is not being reported.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> Not applicable

Criteria	JORC Code explanation	Commentary
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	<ul style="list-style-type: none"> Not applicable as surface sampling is reconnaissance in nature.
<i>Diagrams</i>	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> All the appropriate maps are provided in the body of this announcement.
<i>Balanced reporting</i>	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> This announcement discusses the findings of recent reconnaissance sampling and associated assays.
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> All the meaningful exploration data has been included in the body of this announcement.
<i>Further work</i>	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Errawarra plans to conduct further ground reconnaissance and sampling in the short term to determine the surface extent both laterally and along strike. Drilling will also be undertaken if warranted.
