ASX Announcement

4 July 2024

MANNA ORE SORTING TRIAL CONFIRMS EXCELLENT RESULTS ACROSS RANGE OF ORE GRADES

Ore sorting shows higher spodumene recoveries from the Manna Lithium Project verified by QEMSCAN mineralogical analysis

Key Highlights

- Spodumene recovery >97% across range of ore samples confirmed by QEMSCAN® analysis
- **High iron rejection** at greater than 90% across range of bulk samples
- Ore sorting of low-grade ore achieves significant upgrade from 0.56% to 0.90% Li₂O, potentially enabling lower-grade ores to be economically processed
- Excellent liberation of pegmatite ore from host rock
- Outstanding efficiency of the multi-sensor ore sorting technology
- Incorporation of ore sorting technology into the overall process flowsheet to increase mill feed grade from 1.0% to 1.2% Li₂O

Established multi-asset West Australian Lithium company, Global Lithium Resources Limited (**ASX: GL1**, "**Global Lithium**" or "the **Company**"), is pleased to announce it has completed Ore Sorting Variability Trials at its **100% owned Manna Lithium Project**, 100km east of Kalgoorlie in Western Australia.

This program complements earlier trials performed on ore samples from Manna (refer ASX releases 30 May 2023 and 21 September 2023) and confirms the robustness and applicability of ore sorting technology for the Manna Lithium Project. This testwork forms part of a wider technical scope of work being undertaken by the Company to progress the Definitive Feasibility Study (**DFS**) at the Manna Lithium Project targeting completion in H2, CY24.

Global Lithium Project Director, Dr Tony Chamberlain commented,

"This final round of trials confirms ore sorting is highly amenable to the Manna Lithium deposit. The technology has demonstrated impressive spodumene recoveries, while rejecting a large percentage of associated waste material across a range of ore samples throughout the deposit.

Ore sorting will provide greater flexibility to our mining operations and will allow lower cut-off grades to be economically mined and processed at Manna. With ore sorting now being incorporated into the main flowsheet, this will enable the project to potentially deliver a higher annual production quantity of

spodumene concentrate. These positive outcomes will be incorporated into the Manna Lithium Project DFS which is due for completion in H2 CY24."

Manna Ore Sorting Trials Update

The ore sorting variability test program was performed on six (6) ore samples ranging from 150 to 300kg, with each sample representing a different period in the project's mine life. The samples were composited using over 110m of HQ and PQ diamond drill core selected from seven (7) drill holes within the proposed main open pit at Manna. Three of the samples were diluted with approximately 30% contact waste to simulate expected full-scale mining operations, while the remaining three samples were undiluted and used for confirmation of lithia loss for high-grade ores, and for the calibration of the ore sorter. The samples were crushed to -25mm and screened to remove fines (-8mm), with the screened ore further separated into a mids (-25+18mm) and a fines (-16+8mm) size fraction for some samples, which were then processed through the ore sorter in consecutive runs. The fines (-8mm) size fraction is too small for ore sorting and is by-passed and amalgamated with the ore sorter final product prior to the milling circuit.

The testwork was conducted at the Steinert Test Facility in Perth under controlled conditions utilising calibrated sensor settings developed during the first two ore sorting trials.

The three diluted ore samples from this trial and a previously reported high-grade spodumene sample tested in September 2023 achieved significant upgrades in lithium grades, from 1.41% to 1.75% Li₂O, 1.13% to 1.77% Li₂O, 0.77% to 1.10% Li₂O and 0.56% to 1.31% Li₂O respectively for the high-grade, medium-grade, spodumene-dominant and low-grade ore samples. All samples demonstrated high selectivity for rejecting iron, with rejection to ore sorter Rejects averaging 95% (refer to Tables 1 to 4).

When the fines fraction (-8mm) is recombined to the ore sorter Accepts, the lithium grades for the low-grade ores (low-grade and spodumene-dominant samples), show a 1.2 to 1.6 increase in head grade at >0.90% Li₂O (refer Tables 3 and 4).

Lithia losses for the three diluted ore samples ranged between 4% and 12%, which is consistent with the lithia losses reported for the diluted high-grade ore sample processed through the ore sorting plant in 2023 (refer ASX Announcement 21 September, 2023).

Table 1: Summary of Ore Sorting Results – High-Grade Spodumene Ore with Mine Dilution²

^{1.} Average results from mid and fine-size fractions and recombined with -8mm fraction.

Mineralogical evaluation of the Reject streams from all four diluted ore samples tested was conducted at ALS Metallurgy located at Balcatta, Western Australia, using Quantitative Evaluation of Minerals by Scanning Electron Microscopy (QEMSCAN). The results show the majority of the lithia losses to ore sorted Rejects are in the form of lithium-bearing mica minerals, as shown in Figure 1.

Figure 1. Mineralogy of lithium-bearing particles reporting to the **ore sorted Rejects**.

Figure 2 shows a typical example of the ore sorted Rejects and Accept fractions. The main waste rock types are basalt, gabbro and biotite, which are dark grey to black in appearance and have a range in

magnetic susceptibilities. The ore sorted Accepts are white to light grey in appearance and typically consists of spodumene, quartz, albite (sodium feldspar), microcline (potassium feldspar) and muscovite.

Figure 2. Typical composition of ore sorted Rejects and Accepts.

QEMSCAN results confirmed true spodumene losses to ore sorted Rejects, via misreporting or non-liberated spodumene, are significantly lower than indicated by lithium assays, ranging between 0.1% and 2.9%, indicating excellent liberation of pegmatite ore from contact waste rock. Figure 3 provides the grade recovery curves for the four diluted ore samples tested to date, showing lithia and spodumene losses respectively.

Figure 3. Lithium and spodumene grade recovery curves for the final ore sorting products.

Ore sorting testwork has continued to confirm the amenability of the Manna ore body to upgrading via multi-sensor ore sorting technology, with the following having been established over the past year of testwork across a range of ore samples:

- Excellent recovery of spodumene to ore sorted Accepts at greater than 97%;
- Consistently high iron rejection to ore sorted Rejects at greater than 90%;
- Effective operation of ore sorting technology down to 8mm size fraction;
- Significant upgrade of low-grade ore from 0.56% to 0.90% Li₂O representing a 60% increase in grade;
- Considerable upgrade of high-grade ore from 1.41% to 1.64% Li₂O, associated with a near 25% reduction in waste underpinning an opportunity to export Spodumene Ore Concentrate (SOC) product.

With ore sorting testwork performed on Manna pegmatite ore demonstrating the technology is highly effective in upgrading both low-grade and high-grade ores, the Company has decided to implement the following:

- Incorporation of ore sorting technology into the overall process flowsheet to increase mill feed grade from 1.0% to 1.2% Li₂O, and
- Further financial and technical evaluation of the option to produce SOC for a period of up to 24 months during construction and commissioning of the Manna Processing Plant.

All required testwork for the ore sorting plant for the Manna Lithium Project has now been completed.

Approved by the board of Global Lithium Resources Limited.

About Global Lithium

Global Lithium Resources Limited (ASX:GL1, Global Lithium) is a diversified West Australian lithium exploration and development company with multiple assets in key lithium branded jurisdictions with a primary focus on the 100% owned Manna Lithium Project in the Goldfields and the Marble Bar Lithium Project (MBLP) in the Pilbara region, Western Australia.

Global Lithium has now defined a total Indicated and Inferred Mineral Resource of 69.6Mt @ 1.0% Li₂O at its Manna and Marble Bar Lithium projects, confirming Global Lithium as a significant global lithium player.

Competent Persons Statement:

Metallurgical Testwork Results

The information in this announcement that relates to Exploration Results for the Manna Lithium Project complies with the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code) and is based on, and fairly represents, information and supporting documentation prepared by Dr Tony Chamberlain, a full time employee of Global Lithium Resources Limited and who participates in the Company's Incentive Performance Rights and Option Plan. Dr Chamberlain is a member of the Australasian Institute of Mining and Metallurgy. He has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Dr Chamberlain considers that the information in the market announcement is an accurate representation of the available data and studies for the mining project. Dr Chamberlain consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Mineral Resources

Information on historical exploration results and Mineral Resources for the Manna Lithium Project presented in this announcement, together with JORC Table 1 information, is contained in an ASX announcement released on 12 June 2024.

Information on historical exploration results and Mineral Resources for the Marble Bar Lithium Project presented in this announcement is contained in an ASX announcement released on 15 December 2022

The Company confirms that it is not aware of any new information or data that materially affects the information in the relevant market announcements, and that the form and context in which the Competent Persons findings are presented have not been materially modified from the original announcements.

Where the Company refers to Mineral Resources for the Manna Lithium Project (MLP) in this announcement (referencing previous releases made to the ASX), it confirms that it is not aware of any new information or data that materially affects the information included in that announcement and all material assumptions and technical parameters underpinning the Mineral Resource estimate in that announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons findings are presented have not materially changed from the original announcement.

Appendix 1.

The tables below show the drilling results returned from the Metallurgical and Ore Sorting Diamond core drill program. This program was specifically designed to drill down dip so a bulk sample of the pegmatite could be collected for metallurgical testing requirements. These results and the high-grade intercepts are not to be interpreted as true width of the deposit and have not been added to the resource model.

The results do show that the grade within the pegmatite is consistent with depth and of a higher grade than represented in the resource model. This is due to the natural dilution of Reverse Circulation (RC) drilling and the wider drill spacing.

Further close spaced infill drilling currently being performed at the Manna Lithium Deposit, is designed to improve the classification of the resource model and to bring the overall grade of the deposit more in line with the results observed in the tables below.

				Total	117.02	
Drilling techniques	 Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc). 	upon growAll diamo approxim	und conditiond drill hole	ns. s were ang -80 degree	Q2 dependent led at s and aligned t	
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	measured recovery recovery. geologists site. There is recovery	d by tape mod is recorded is calculated This is cors during corno observab	easure and d for every d as a perce offirmed by 0 e orientatio	run. Core entage	
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or 	mineralisa and obvio	ation, struct	ure, weathe nation by a	gy, alteration, ering, wetness geologist. Data e.	а

Criteria	JORC Code explanation	Commentary
	 quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	
Sub- sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	 Half core samples were taken, generally on 1m intervals or on geological boundaries where appropriate (minimum 0.08m to maximum of 1.36m). The samples were sent to accredited laboratories for sample preparation and analysis. All samples were sorted, dried pulverised to 75µm to produce a homogenous representative subsample for analysis. A grind quality target of 85% passing -75µm has been established
Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	 Ore Sorting Samples The ore sorting process was conducted by Steinert in Perth Western Australia. The process utilises a combination of colour camera, 3D laser, induction sensor and X-Ray sensor to differentiate inputs into waste and those matching parameters of target elements. These four sensors can be utilised to tailor an optimum combination for specific mineralisation mineralogy. The resulting concentrates were analysed via ICP-MS and compared to initial assays undertaken by Global Lithium in 2022. This enabled Steinert to determine the grade upgrade achieved in the various tests. The assay technique is considered to be robust as the method used offers total dissolution of the sample and is useful for mineral matrices that may resist acid digestions. Multielement analysis will be carried out on assay samples for the following elements: Al, Be, Ca, Cs, Fe, Ga, K, Li and Li2O, Mg, Mn, Mo, Nb, P, Rb, S, Si, Sn, Ta, Ti and V.
Verification of sampling and assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) 	 Results were verified by alternative personnel at Global Lithium Twin holes have been drilled at Manna lithium project in both RC and DD to allow correlation of the assay results between drilling styles and to provide more confidence in the resource model. Primary geological and sampling data were

Criteria	JORC Code explanation	Commentary
	protocols. • Discuss any adjustment to assay data.	recorded digitally and on hard copy respectively and were subsequently transferred to a digital database where it is validated by experienced database personnel assisted by the geological staff. Assay results are merged with the primary data using established database protocols Global Lithium has not adjusted any assay data, other than to convert Li (ppm) to Li2O (%). Snowden Optiro converted Ta to Ta2O5 following grade estimation
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 A handheld global positioning system (GPS) was used to initially record drillhole locations (±5m accuracy), followed by a differential GPS surveyor pickup. Downhole survey measurements taken at 10m intervals for RC drillholes and at an average interval of 5m for diamond drillholes GDA94 (MGA) Zone 50 Southern Hemisphere Topographical data provided on a 50m by 50m grid. Global Lithium plans to acquire more detailed topographical data
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	 The Manna deposit has been drilled at a spacing of around 80m along strike by 40m across strike. Drill spacing is appropriate for the Mineral Resource estimation and classification applied. Samples were not composited except for metallurgical test work
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	No orientation data was collected as the drilling was down Dip and not used in a resource model.
Sample security	The measures taken to ensure sample security.	 The diamond core samples are taken from the drilling rig by experienced personnel, stored securely and transported to the laboratory by a registered courier and handed over by signature.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	 Data inputs and outputs have been reviewed and verified by Global Lithium and Steiner No audits have been undertaken to date.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 The Manna Lithium deposit is situated entirely within tenement WA exploration licence E28/2522 and E38/2551 All tenure is wholly owned by Global Lithium Resources Limited. The portfolio of mineral tenements, comprising two granted exploration licences are in good standing.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	 Mineral exploration over the Eastern Kalgoorlie project area has been undertaken for a number of commodities, including gold, base metals, diamonds, tin and tantalum by various companies since the 1960s. Breaker Resources performed a basic mapping and geochemical sampling program over the area before running a small RC drilling program of 23 holes totalling 3428m that defined the Manna Lithium deposit After acquiring the project in 2021, GL1 is performing a large RC and Diamond drilling campaign that will result in the declaration of an upgraded Mineral Resources.
Geology	Deposit type, geological setting and style of mineralisation.	 Typical LCT pegmatite model occurring as swarms of dykes in a preferred corridor orientation. Within this area, the Company has discovered the Manna deposit, comprising a series of steeply dipping pegmatite bodies with lithium mineralisation predominantly by way of spodumene hosted pegmatites. These pegmatites have been the focus of exploration by the Company
Drill hole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information 	 Refer to ASX announcement "43% Increase in Manna Lithium Deposit Mineral Resource", release on 12 June 2024.

Criteria	JORC Code explanation	Commentary
	for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	Not relevant – exploration results are not being reported; a Mineral Resource has been defined
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	Not relevant – exploration results are not being reported; a Mineral Resource has been defined
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to ASX announcement "43% Increase in Manna Lithium Deposit Mineral Resource", release on 12 June 2024.

Criteria	JORC Code explanation	Commentary
Balanced reporting	 Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	All results are being reported in this release.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All relevant information is disclosed in the attached release and/or is set out in this JORC Table 1.
Further work	 The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	Global Lithium has completed sufficient sorting testwork to support its Definitive Feasibility Study.
