QUARTERLY ACTIVITIES REPORT FOR THE QUARTER ENDING JUNE 30, 2024

HIGHLIGHTS

Canada:

- Mineralogical studies and hyperspectral survey completed at Schryburt Lake
- XRD and SEM analyses confirm REE minerals ancylite in Schryburt Lake samples
- Ancylite is closely related bastnäsite, which is a common REE mineral in carbonatites and proven to be amenable to ore processing

Australia:

- Reconnaissance rock chip sampling, soil sampling and ASTER mineral mapping completed at Biloela during June 2024 quarter
- High grade rock chip samples in breccia hosted mineralisation with peak values of 11 g/t Au, 198 g/t Ag and 42.1% Cu

Bindi Metals Limited (**ASX:BIM**, “**Bindi**” or the “**Company**”) is pleased to deliver the June Quarter Activities Report to shareholders. During the quarter, X-ray diffraction (XRD) results were reported at the Schryburt Lake REE-niobium Project in Canada and results of regional geochemical work at the Biloela Project in Queensland.

Operations

Canada – Schryburt Lake Rare Earth and Niobium Project

Permitting is ongoing for drilling activities at Schryburt alongside technical studies at the Project. Negotiations with the relevant First Nations groups on access agreements are ongoing with progress made towards the grant of a drill permit.

XRD and SEM studies were undertaken during the quarter with encouraging results from mineralised carbonatite samples at Schryburt Lake. XRD analysis confirmed ancylite and carboternaite REE bearing minerals in rock chip from the Blue Jay prospect, which assayed of 3.6% TREO and 0.5% Nb₂O₅. SEM probes also supported these results determining ancylite-(Ce), carboternaite, baryte, calcite and dolomite (see Figure 1).

Specifically the ancylite Ce dominant variety $[Sr(Ce,La)(CO_3)_2(OH)\cdot H_2O]$ was confirmed while also containing subordinate La and Nd with carboceernaite $[(Ca,Na)(Sr,Ce,Ba)(CO_3)_2]$. Both are carbonate REE minerals.

The ancylite group is a hydrated carbonate mineral species that is closely related to the bastnäsite group and can form as a secondary mineral to bastnäsite. The bastnäsite group of minerals is the dominant ore type for REE mines globally with a weight percentage of 75% TREO within the mineral structure.

Figure 1. Backscatter electron image (SEM) of sample-01 showing ancylite-(Ce) forming blocky to prismatic crystals and carboceernaite. Baryte is also present, intergrown with the two REE minerals.

While the XRD/SEM results are preliminary in nature, the identification of ancylite is encouraging due to its similarity with bastnäsite while also indicating potential for bastnäsite mineralisation within the Schryburt Lake system. It is important to note that this ore is amenable to ore processing and is the dominant ore type mined for REE within carbonatite deposits.

Hyperspectral analysis completed during the quarter has identified three potential new carbonatite intrusives within the regional Schryburt Lake project. The spectral signature of these new anomalies is similar to the Schryburt Lake carbonatite indicating these new targets are prospective for REE-niobium mineralisation.

Australia – Biloela Copper-Gold Project

Bindi completed a regional soil survey at the Biloela project focusing on the Old Kroombit prospect, following on from soil programs completed at Cave Mountain and Tea Tree. Follow up mapping and sampling were completed at anomalies generated in the soil program.

ASTER satellite imagery was processed to identify key mineral assemblages that are common in epithermal and porphyry copper alteration systems. This is a proven technology in porphyry copper exploration.

Key results from regional prospects at the Biloela project include:

- Cave Mountain: new breccia hosted system with 11.4 g/t Au and 1.6% Cu from a 1.2 km Au soil anomaly;
- Old Kroombit: vein hosted mineralisation with 2.4 g/t Au, 198 g/t Ag and 42.1% Cu from a 1.4 km Au-Cu soil anomaly; and
- Karita: new epithermal style mineralisation with subcropping veins over ~1 km and peak values of 0.2 g/t Au, 135 g/t Ag and 6.7% Cu.
