

## Nb-REE Detected at Avalon and Sheoak West Arunta Project

### PRELIMINARY OBSERVATIONS

- Hand-held pXRF<sup>1</sup> analysis has detected niobium ('Nb') and rare earth elements ('REE')<sup>2</sup> anomalism associated with syenite intrusions at the Avalon and Sheoak targets.
- While generally consistent with typical whole-rock geochemical values of Syenite's, some elevated REE elements (La, Ce, Pr, Nd, Sm, Eu and Y) were detected in altered syenite at Sheoak.
- The drilling program has confirmed that the gravity anomalies at Avalon and Sheoak appear to be caused by the following geological units which lay beneath a shallow sand and laterite-clay profile:
  - At Avalon, the gravity anomaly high can be attributed to dense mafic to ultramafic volcanic and sub-volcanic rock units, intruded by syenite dykes and sills.
  - At Sheoak, the gravity anomaly high can also be attributed to similar dense mafic to ultramafic volcanic host rocks and wide zones of syenite, likely representing the upper portion of a larger intrusive body at depth.
- Based on the preliminary pXRF data, it is currently interpreted that the rock sequences at Avalon and Sheoak suggest the presence of an alkaline igneous complex, potentially related to Nb-REE bearing carbonatite intrusions.

### CURRENT STATUS

- All reverse circulation ('RC') drilling samples have arrived in Perth, and laboratory analysis is in progress.
- Diamond drillholes ('DDH') from Sheoak (24WARC018D) and K1 (24WARC022D) targets are in transit to Perth, where they will undergo XRF analysis and multi-spectral scanning using GALT Mining Services' BoxScan logging system.
- The Avalon target DDH 24WARC013D was cut and sampled on site, with the samples currently en-route to Perth for assaying.

<sup>1</sup> Portable X-Ray Fluorescence (pXRF) is a first-pass rapid assay method used to get a sense of element concentration in the field.

<sup>2</sup> Rare Earth Elements comprise a group of 15 periodic elements: La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb and Lu.

### **Cautionary Statement:**

In relation to pXRF results, the Company cautions that such element concentration results are non-definitive and should be considered indicative only and do not form proxy or substitute for laboratory assay analysis. Laboratory assay results are required to confirm the validity and veracity of the pXRF results and to determine any potential estimation of widths and grade of any anomalous and mineralised drilling intersections. The Company will update the market when laboratory analytical assay results become available.

*Commenting on the drilling results, Rincon's Managing Director Gary Harvey said:*

*"A hand-held pXRF unit was used in the field to assist in determining geology and to detect Nb and REEs and has revealed the presence of a potentially large alkaline intrusive complex of syenite intrusions and related alteration. We are aware that syenites and carbonatites coexist in calc-alkaline intrusive complexes that host significant Nb-REE deposits globally. This is very encouraging, and our challenge now is to determine if this coexistence occurs within Rincon's West Arunta Project area."*

**Rincon Resources Limited** (ASX: RCR) ("Rincon" or "Company") is pleased to provide preliminary observations from its initial RC and DDH drilling program that tested the Avalon, Sheoak, K1, and K2 gravity anomaly targets at its West Arunta Project in Western Australia (refer to Figure 1).

A total of 13 RC holes and three DDH tails were drilled, encompassing 3,746 metres to test the four gravity anomaly targets — Avalon, Sheoak, K1, and K2 — outlined by ground gravity surveys earlier this year (refer to Figure 1, Table 1) (*refer to ASX: RCR Announcement dated 22 April 2024, available to view at [www.rinconresources.com.au](http://www.rinconresources.com.au).*)

Preliminary hand-held pXRF data collected on RC pulp and DDH core samples has detected weakly anomalous zones of Nb and REE's, primarily within the shallow lateritic clay-rich profile at Avalon and Sheoak (see Figures 2 to 6 and Table 2).

Initial observations suggest that the Nb-REE anomalism is associated with syenite intrusive rocks rather than an obvious carbonatite intrusive body, with the host rocks to the intrusion, and source of the gravity anomaly targets, being unexpected dense mafic to ultramafic volcanic and intermediate porphyritic sub-volcanic rocks, indicative of an earlier volcanic event or as rock units which have formed around the same time as an alkaline igneous complex.

Slightly elevated REE's (La, Ce, Pr, Nd, Sm, Eu, and Y) were detected using the pXRF on fresh rock drilling samples and associated with altered zones of syenite at Sheoak (refer to the Alkaline intrusive and carbonatite model shown in Figure 7). The syenite drilling intersections at Sheoak are significant in width (refer to Table 2) and display considerable variability in texture, grain size, and alteration. Notably, the Sheoak DDH 24WARC018D, ended in increasingly altered syenite, which may represent the upper portion of a large alkali intrusive body at depth.

At Avalon, syenite is observed as a series of dykes and/or sills ranging from 0.2 metres to 10's of metres in thickness.

While these preliminary observations are based on early field observations of drill samples and hand-held pXRF data, the Company is highly encouraged by the presence of syenite associated with elevated Nb-REE's, because such occurrences have potential to coexist with carbonatite intrusions within such alkaline igneous complexes that host significant Nb-REE deposits (refer to Figure 7). On this basis, the Company is already considering additional drilling, which may include:

- Extending DDH 24WARC018D at Sheoak to fully assess the extent of the syenite and test the undrilled zone below the peak of the gravity anomaly high.
- Adding a DDH tail to extend Avalon RC hole 24WARC014 to fully intersect the gravity anomaly high zone and determine if syenite or carbonatite is present below, and
- Drilling additional RC holes at the Avalon gravity high to areas of interpreted demagnetisation that may host Nb-REE enrichment within the shallow lateritic-clay rich zones formed in the weathering profile.

The Company will provide further updates on its West Arunta Project exploration results once it has been able to assess drilled samples in more detail and obtain laboratory assay results to validate and confirm initial hand-held pXRF observations.

**NOTES:** Easting and Northing are measured in metres (m) and refer to the GDA94 datum and MGA Zone 52 coordinate reference system.

Elev. (Elevation) is in measured metres (m) and relative to the Australian Height Datum (AHD84).

Dip and Azim (Azimuth) are measured in degrees. Dip is the angle of the hole from surface level, and Azim is the direction of the hole relative to True North (TN). Depth is the total depth of the drillhole and measured in metres (m) and is the total length of the drillhole from surface level.

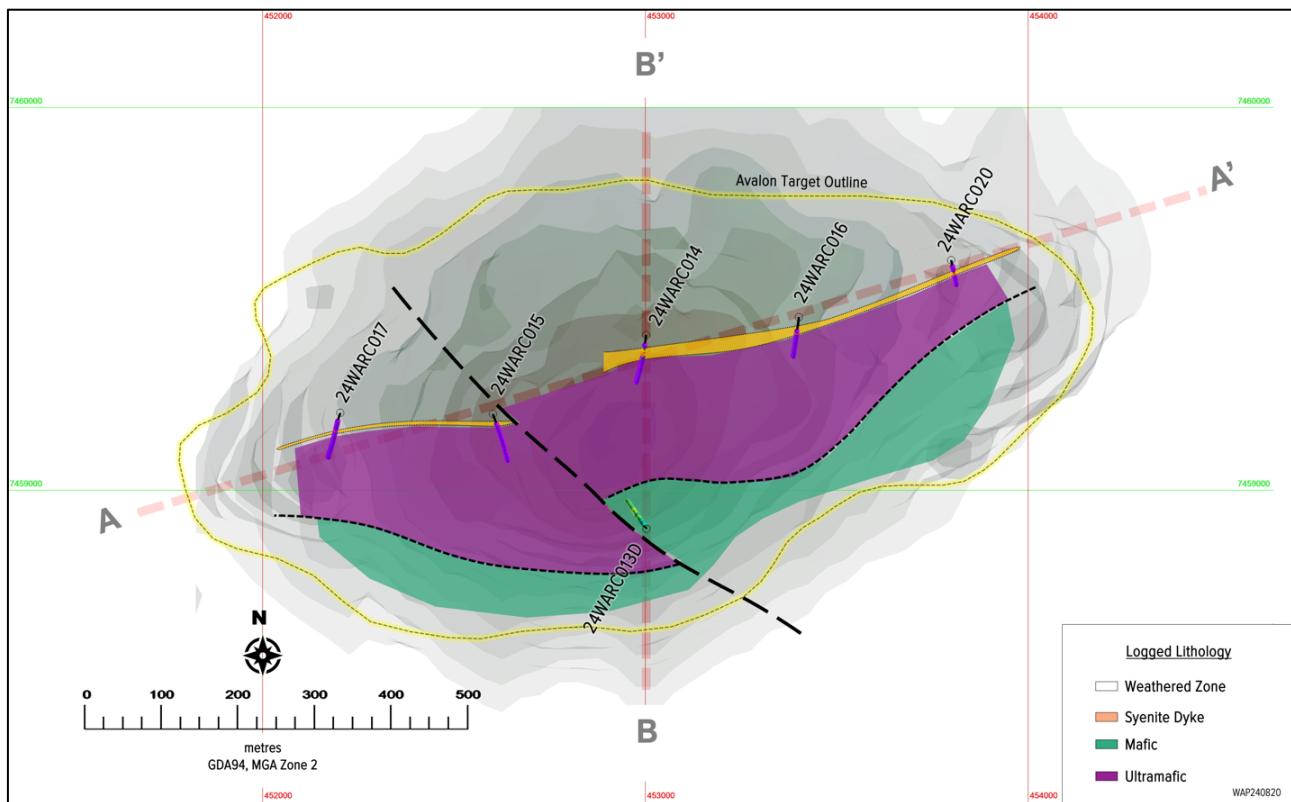

Figure 2 – Drillhole location plan showing the Avalon gravity anomaly target outline (yellow), overlying a 3D-gravity inversion model slice of density iso-surface shells ranging from 2.75 g/cc (outer) to 2.97 g/cc (inner), and interpreted lithology based on visual observations and preliminary pXRF data based on drilling samples.

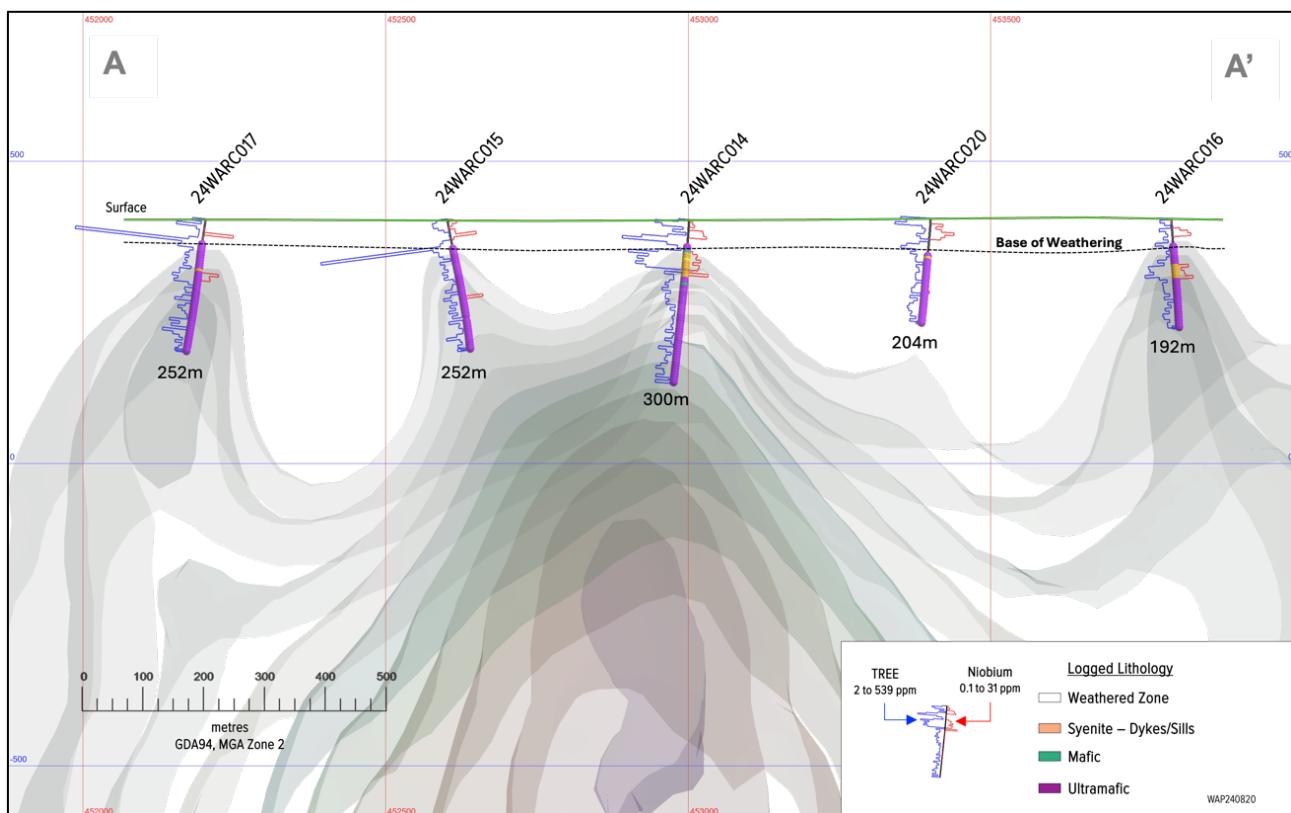

Figure 3 – Avalon schematic cross section A-A' (looking north, see Figure 2) showing drill traces coloured by interpreted lithology, with pXRF Nb indicated on the right side of trace (red bars) and TREE on the left side of trace (blue bars), overlying a 3D gravity inversion model of density iso-surface shells ranging from 2.75 g/cc (outer) to 2.97 g/cc (inner).

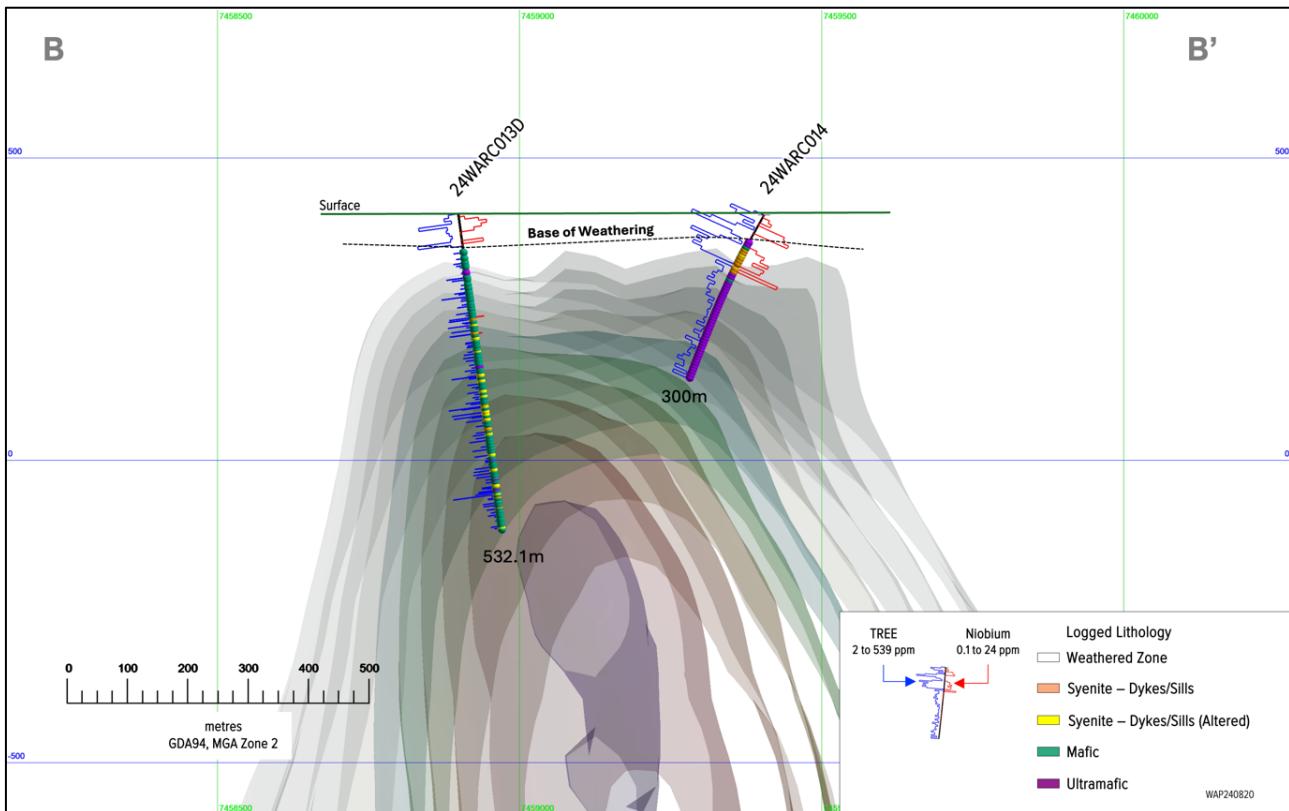

Figure 4 – Avalon schematic cross section B-B' (looking west, see Figure 2) showing drill traces coloured by interpreted lithology, with pXRF Nb indicated on the right side of trace (red bars) and TREE on the left side of trace (blue bars), overlying a 3D gravity inversion model of density iso-surface shells ranging from 2.75 g/cc (outer) to 2.97 g/cc (inner).

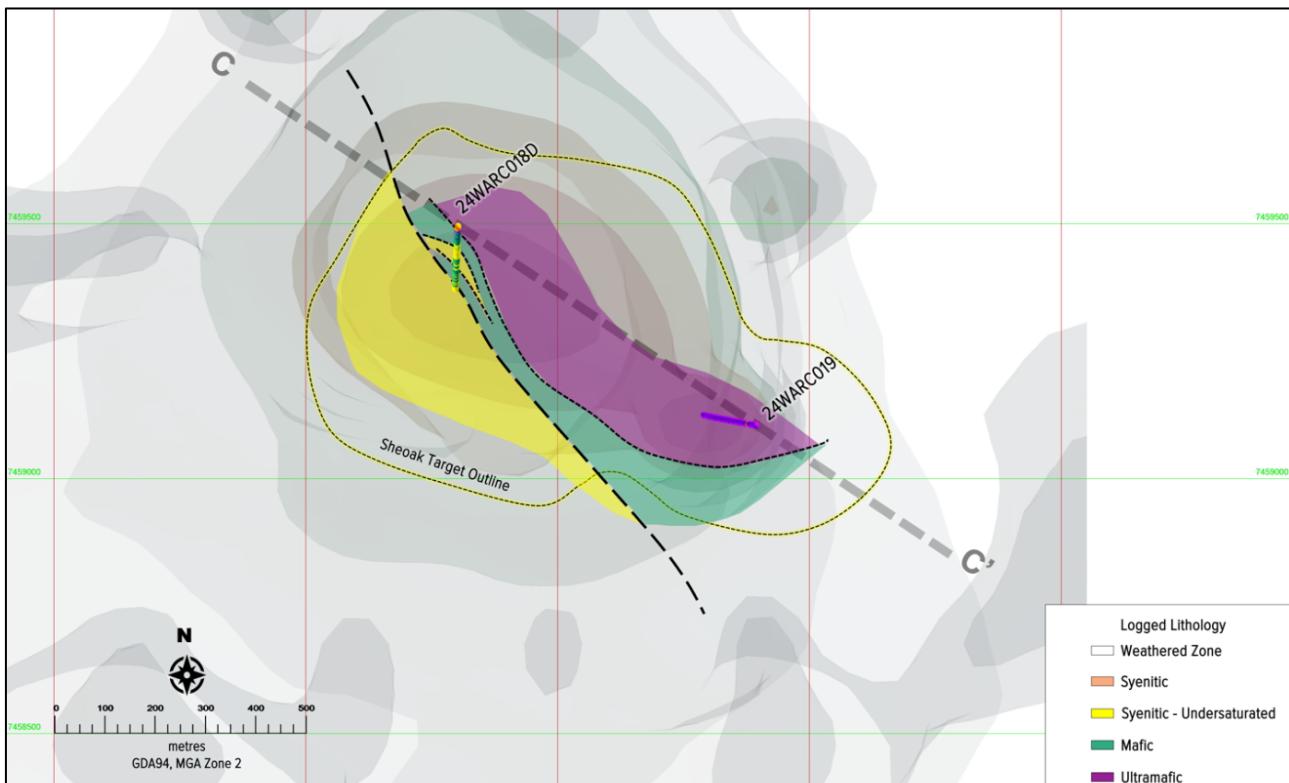

Figure 5 – Drillhole location plan showing the Sheoak gravity anomaly target outline (yellow), overlying a 3D-gravity inversion model slice of density iso-surface shells ranging from 2.75 g/cc (outer) to 2.97 g/cc (inner), and interpreted lithology based on visual observations and preliminary pXRF data based on drilling samples.

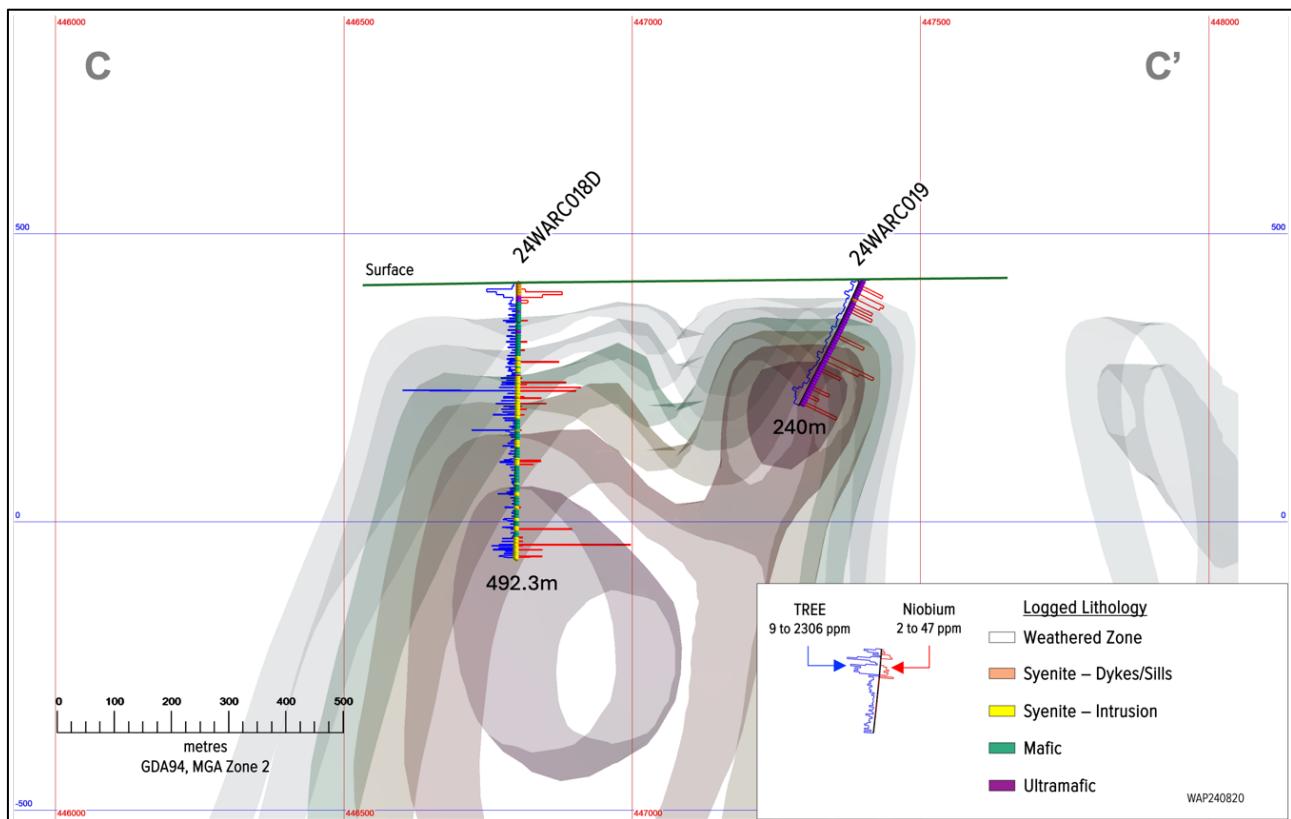

Figure 6 – Sheoak schematic cross section C-C' (looking north, see Figure 5) showing drill traces coloured by interpreted lithology, with pXRF Nb indicated on the right side of trace (red bars) and TREE on the left side of trace (blue bars), overlying a 3D gravity inversion model of density iso-surface shells ranging from 2.70 g/cc (outer) to 2.82 g/cc (inner).

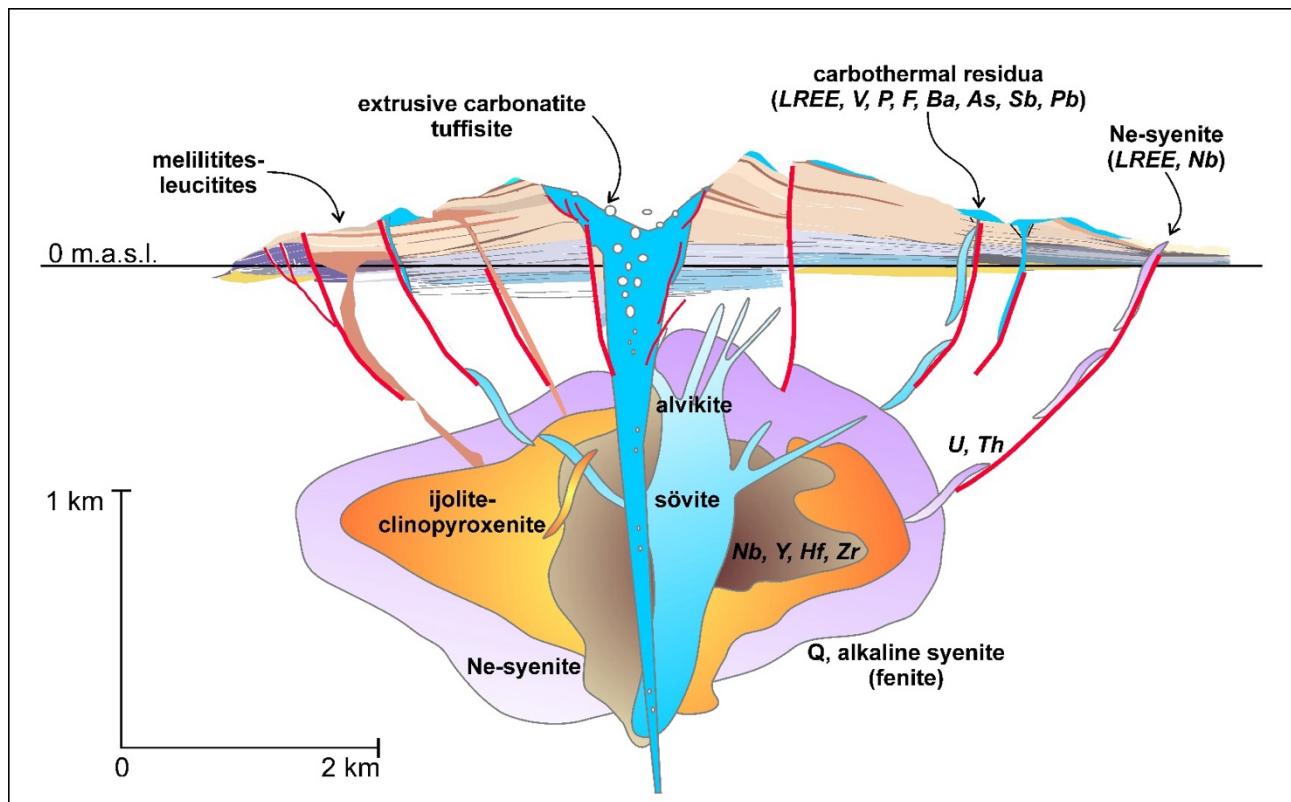

Figure 7 – The above schematic geological model illustrates the relationship between alkali intrusions (including syenite), sub volcanic intrusions, volcanics, carbonatite intrusions and carbothermal systems (modified after Le Bas, 1977 and sourced from Pirajno 2024: Carbonatites, alkaline complexes and associated REE mineral systems and their significance in modern technology, CET presentation).

**Table 2 – Hand-held Portable X-Ray Flourescence (pXRF) readings taken on drilling samples (note: readings are provided in parts per million ('ppm') and blank data cells represent values which are below detection.**

## About Rincon

Rincon has 100% interest in three exploration assets in Western Australia that are highly prospective for copper, gold, Nb, REE's, and other critical metals required for the energy transition. These are the South Telfer Project, West Arunta Project and Laverton Project.

Each asset has previously been subject to historical exploration which has identified prospective mineral systems that warrant further exploration. The Company aims to create value for its shareholders by advancing its assets through the application of technically sound, methodical and systematic exploration programs to test, discover and delineate economic resources for mining.

West Arunta Project – Tenement Location Map

#### Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled by Mr Gary Harvey who is a Member of The Australian Institute Geoscientists and is Managing Director of the Company. Mr Harvey has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Harvey consents to the inclusion in this report of the matters based on this information in the form and context in which it appears..

#### Future Performance

This announcement may contain certain forward-looking statements and opinions. Forward-looking statements, including projections, forecasts and estimates, are provided as a general guide only and should not be relied on as an indication or guarantee of future performance and involve known and unknown risks, uncertainties, assumptions, contingencies and other important factors, many of which are outside the control of the Company and which are subject to change without notice and could cause the actual results, performance or achievements of the Company to be materially different from the future results, performance or achievements expressed or implied by such statements. Past performance is not necessarily a guide to future performance and no representation or warranty is made as to the likelihood of achievement or reasonableness of any forward-looking statements or other forecast. Nothing contained in this announcement, nor any information made available to you is, or and shall be relied upon as, a promise, representation, warranty or guarantee as to the past, present or the future performance of Rincon.

**JORC Code, 2012 Edition – TABLE 1****West Arunta Project, RC and Diamond Drilling Program at Avalon, Sheoak, K1 and K2 targets.****SECTION 1 – Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<p>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</p>	<p><b>RC Drilling:</b> Drill chips passing through a cyclone and cone splitter were collected and sampled every 1m (split sample) and preserved for follow-up analysis if required. 2m composite samples were collected using a scoop and sent to the laboratory for first-pass analysis.</p> <p><b>Diamond Drilling:</b> After orientation, drill core was cut in half, with half of the core collected and sampled for laboratory analysis. The remaining half stored securely for reference.</p> <p><b>XRF Sampling:</b> Systematic pXRF readings were taken for every 5m interval (5m composited sieved fines) for all RC drillholes. Selective spot pXRF readings were taken on diamond core holes 24WARC013D and 24WARC018D, at intervals ranging from 0.5m to 5m apart along the entire core length.</p>
	<p>Include reference to measures taken to ensure sample representation and the appropriate calibration of any measurement tools or systems used.</p>	<p>Sampling was carried out under Company procedures, including QAQC protocols.</p> <p>For pXRF devices, these are calibrated externally by Portable Spectral Services.</p>
	<p>Aspects of the determination of mineralisation that are Material to the Public Report.</p> <p>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</p>	<p><b>Diamond Drilling:</b> No Diamond core sampling has yet been undertaken for laboratory analysis.</p> <p><b>RC:</b> samples (2.5 to 3.5kg) were sent to ALS Perth. A 0.25g sub-sample is collected and digested using their MSME61L and MS61L-REE (4-acid digestion) and analysed via ICP-MS for multi/REE elements.</p> <p><b>XRF Sampling:</b> Sieved and composited 5m interval samples were collected from RC chip sample piles and read with a Bruker S1-Titan pXRF unit. pXRF spot readings of diamond core roughly every 0.5m to 5m were selected based on visual mineralisation, alteration and lithology. The Bruker S1 Titan pXRF unit was rented from Portable Spectral Services and calibrated and set-up with the REE_IDX Calibration programming. The REE_IDX Calibration reads the following elements: Al, As, Ba, Ca, Ce, Cr, Cu, Dy, Er, Eu, Fe, Gd, Ho, K, La, Lu, Mg, Mn, Nb, Nd, Ni, P, Pb, Pr, S, Si, Sm, Sr, Tb, Th, Ti, Tm, U, V, Y, Yb, Zn, Zr, HREE, LREE, TREE. Readings are indicative only and can have error margins greater than the actual reading, resulting sometimes with negative values, particularly for very light or very heavy elements. The Company requires laboratory assays to confirm any zone of anomalism and to validate any observations or interpretations made.</p>
Drilling techniques	<p>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</p>	<p><b>RC Drilling:</b> RC drilling was completed using a using a 5.5-inch face sampling hammer. Downhole surveying was completed using an AXIS north seeking gyro.</p> <p><b>Diamond Drilling:</b> Drill core was both HQ2 (~7cm diameter) and NQ2 (~5cm diameter). Drill core was oriented using an ACT Mk2 NQ/HQ Core Ori kit. Downhole surveying was completed using an AXIS north seeking gyro.</p>

Criteria	JORC Code explanation	Commentary
<b>Drill sample recovery</b>	Method of recording and assessing core and chip sample recoveries and results assessed.	<b>RC Drilling:</b> > 80% of sample return was achieved on average. Most samples were dry. Sample recoveries were visually estimated, and any low recoveries recorded in the drill logs. Sample quality was noted on the drill logs. <b>Diamond Drilling:</b> Generally, 100% of sample return is achieved. Rare sample loss occurred through weathered zones near the beginning of core.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	No measures were taken to maximise sample return as this was not an issue.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	A relationship between sample recovery and grade has not been established.
<b>Logging</b>	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Holes are inspected by Company Geologists, with detailed logging using the Company's logging scheme system. Diamond core is logged for geology, mineralisation, alteration, veining and structure, rock quality (RQD) and fracture frequency, which can be used to support a mineral resource. No metallurgical work has been undertaken.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	Logging of RC and diamond core records lithology, mineralogy, mineralisation, weathering, colour, grain size and structural fabric and veining. RC chip trays and diamond core trays and photographed and retained for future reference.
	The total length and percentage of the relevant intersections logged.	Length of intersections are measured by counting samples for RC and measured to the nearest metre. For diamond, lengths and percentages are measured to the nearest centimetre.
<b>Sub-sampling techniques and sample preparation</b>	If core, whether cut or sawn and whether quarter, half or all core taken.	Half-core only (left-side) is sampled for analysis. Core is cut using an Almonte automatic core saw.
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	RC samples are collected via a rotary cyclone and cone splitter. Samples are recorded as dry, wet, or damp.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	The nature and quality of the sampling is appropriate for the type of deposit being explored for.
	Quality control procedures adopted for all sub-sampling stages to maximise representation of samples.	Certified Reference Materials (CRM's), duplicates and blanks are inserted at a rate of 1:50 into the sampling sequence and analysed with each batch of samples. These quality control results are reported along with the sample values in the final report. Selected samples are also re-analysed to confirm anomalous results.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	RC sampling procedures ensure that scoop sampling is such that the sample collected is representative by scooping through the center of sample pile from top to bottom.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	Sample sizes are considered appropriate to give an indication of mineralisation given the particle sizes.
<b>Quality of assay data and laboratory tests</b>	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Four-acid digestion is a near total digestion of the sample and analytical techniques used are appropriate for multi-element and REE analysis. Fire assay is a total digestion of the sample and considered the 'gold standard' for gold analysis. The internal use of a Bruker S1-Titan pXRF was used every five metres for RC sample, while every 5 metres and selectively used on zones of visual mineralisation, alteration, and areas where different lithology was present, to aid in litho-geochemical interpretations in diamond core. The Company still required laboratory results to verify the observations made.

Criteria	JORC Code explanation	Commentary
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	A Bruker S1-Titan pXRF unit was used to detect a selective suite of elements and calibrated specifically to read REE elements (REE_IDX calibration). Readings are measured using three X-ray beams for 150 seconds (Beam1-30s, Beam2-90s, and Beam3-30s) per reading. Machine calibration was completed by Portable Spectral Services prior rental.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Certified Reference Material (Standards and Blanks) were inserted and read regularly throughout the sequence. Readings were within acceptable standard deviations for the analytical method used.
<b>Verification of sampling and assaying</b>	The verification of significant intersections by either independent or alternative company personnel.	Intersection calculations have been verified and checked by the competent person.
	The use of twinned holes.	No twin holes were drilled.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Data is entered electronically on site. Assay files are received electronically from the Laboratory and sent direct to an external database management consultant. All data is stored in a Company database system and maintained by the Database Manager.
	Discuss any adjustment to assay data.	No adjustments to data have been undertaken.
<b>Location of data points</b>	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Drill collar locations were located a navigational GPS. The drill rig mast is set up using a clinometer and rigs were orientated using handheld compass.
	Specification of the grid system used.	Grid projection is GDA94, MGA Zone 52.
	Quality and adequacy of topographic control.	Collar elevations were located using a current Digital Terrain Model for the area. The accuracy of the DTM is estimated to be better than 1m.
<b>Data spacing and distribution</b>	Data spacing for reporting of Exploration Results.	This phase of drilling was designed to test isolated geophysical targets and structures that may be associated with copper, or REE-Nb mineralisation. The data spacing of 2m or less is appropriate for reporting results.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The drilling is a first pass drilling program. The data spacing is insufficient to be used for resources calculations at present.
	Whether sample compositing has been applied.	All samples are split using the cyclone splitter. All 2m composites are collected separately for analysis.
<b>Orientation of data in relation to geological structure</b>	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	The orientation of the drill hole (azimuth) was perpendicular to the interpreted strike of the targeted mineralisation and or designed to test a geophysical target at depth.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	There is insufficient information to determine this.
<b>Sample security</b>	The measures taken to ensure sample security.	Samples are stored in offsite secured storage facilities or retained at the laboratory.
<b>Audits or reviews</b>	The results of any audits or reviews of sampling techniques and data.	No specific audits or reviews have been undertaken at this stage in the program.

## SECTION 2 – Reporting of Exploration Results

(Criteria listed in the preceding section also applies to this section).

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The RC/Diamond drilling program was undertaken on the Company's wholly owned tenement (E80/5241) and located within a Use & Benefit for Aboriginal Inhabitants Reserve. The Company has Ministerial Consent to Enter the Reserve and a Native Title Agreement with the Kiwirrkura Native Title Holders. There are no other third-party royalties or agreements affecting the tenement.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	E80/5241 is currently subject to an Extension of Term application for a further period of 5 years.
<b>Exploration done by other parties</b>	Acknowledgment and appraisal of exploration by other parties.	Previous work on E80/5241 has been completed by Ashburton Minerals, Aurora Gold, Toro Energy and BHP Limited spanning a period of over 30 years.
<b>Geology</b>	Deposit type, geological setting and style of mineralisation.	The Project is located in the West Arunta Region and Aileron Province of WA and is considered prospective for IOCG and carbonatite-related REE systems.
<b>Drill hole Information</b>	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	Refer to Table of Collar information in the body of text.
<b>Data aggregation methods</b>	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	Refer to Table of Results in the body of text.
	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	Refer to Table of Results in the body of text.
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalent result are reported.
<b>Relationship between mineralisation widths and intercept lengths</b>	These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	There is not enough information to determine true widths. All indicated widths are downhole widths only.
<b>Diagrams</b>	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to Figures in the body of text.
<b>Balanced reporting</b>	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low	Refer to results reported in body of text.

Criteria	JORC Code explanation	Commentary
	and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	
<b>Other substantive exploration data</b>	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	Refer to the Discussion section in the body of text.
<b>Further work</b>	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>The Company needs to wait until laboratory assays have been received to fully assess the outcome of the program and determine nexts steps at Avalon, Sheoak, K1 and K2.</p> <p>The Company has other activities planned to commenced at Pokali Q3 2024.</p>
