archTIS Launches Trusted Data Integration to Expand into \$474B Big Data Market

New archTIS structured data solution integrates, secures and governs sensitive and classified data from multiple sources at scale and speed

archTIS Limited (ASX:AR9, OTCQB:ARHLF), a global provider of data-centric software solutions for the secure collaboration of sensitive information, today announced the launch of archTIS Trusted Data Integration, a new lightweight, fast, and agile solution for integrating, securing, and governing sensitive and classified structured data from multiple sources at scale and speed.

Based on the success of Kojensi and NC Protect to secure documents and files, many archTIS customers requested a similar capability for structured data. archTIS Trusted Data Integration (TDI) leverages the company's unique IP to provide a new product to meet this customer demand. This is archTIS' first product that addresses the structured Big Data market. The ability to manage unstructured and structured data presents a significant market growth opportunity as the Big Data market, which encompasses both, is estimated to be worth \$474 billion by 2030. This market is growing at 12.7% compound annual growth rate (Acumen Research and Consulting). TDI offers the opportunity for archTIS to grow existing and acquire new customers in the Defence market.

Defence and supply chain operations heavily rely on a massive network of structured data, which accounts for 20% of all enterprise data. Organisations spend 60% of their tech budget on analysing and managing structured data. Defence organisations in particular struggle with the ability to consolidate distributed sensitive and classified structured data and display it in a secure, segmented, compliant and auditable manner. Solving data management challenges with agility to meet business and operational needs is crucial to unlocking the potential of a competitive data-driven organisation.

The TDI solution provides a lightweight, fast and agile solution to solve the problem at scale and speed. It adds zero trust capabilities to structured data access with centralised security policy orchestration to enforce 'need to know' and 'need to share' principles across the data landscape. A policy authoring engine and workflows make it easy to securely display data based on the user and provide reporting for compliance. It provides centralised security policy orchestration and enforcement using attribute-based access control (ABAC) to ensure data is secure and governed.

Daniel Lai, Managing Director and CEO of archTIS, said: "This latest innovation demonstrates archTIS' ability to generate and commercialise valuable intellectual property assets which we believe will increase shareholder value. By actively listening to our customers, such as our engagement with KPMG in the One Defence Data Program, we are always looking to innovate and expand our offerings to better meet their needs. Our Defence industry clients struggled to integrate and aggregate classified structured data while maintaining strict compliance requirements and tightly controlling access. Leveraging our deep expertise in policy-enforced ABAC and unstructured data protection, TDI expands our product stack to offer a solution for integrating, visualising and securing structured data at scale. TDI is designed to enable secure data fabric-enabled Defence and supply chain data services. It solves these challenges with agility to meet business needs and enable customers to maintain a competitive edge."
