

Company Update

Key Highlights:

- ❖ The *U-pgrade™* metallurgical beneficiation program on Koppies ore is progressing well and will inform the design of an *U-pgrade™* demonstration plant.
- ❖ The Company is focussed on operating an *U-pgrade™* demonstration plant and proving that *U-pgrade™* works on Koppies ore late CY2025.
- ❖ Resource expansion and exploration programs continue in Namibia at the Hirabeb, Namib IV, Capri and Marenica uranium projects.
- ❖ The Hirabeb drilling program has identified significant intersections adjacent to the maiden resource estimated in October 2024 including:
 - HIR1730 1.5 m at 292 ppm eU₃O₈ from 9.0 m
 - HIR1751 2.0 m at 545 ppm eU₃O₈ from 25.5 m
- ❖ Namib IV and Capri exploration includes phased greenfield and infill drilling programs, targeting maiden resource estimates during 2025.

Namib IV – significant intersections:

- NIV0349 3.5 m at 2,053 ppm eU₃O₈ from 3.5 m
- NIV0285 18.0 m at 267 ppm eU₃O₈ from 10.0 m
- N4R243 1.5 m at 1,110 ppm eU₃O₈ from 0.5 m
- N4R046 3.0 m at 535 ppm eU₃O₈ from 0.5 m

Capri – significant intersections

- CAP0154 4.5 m at 942 ppm eU₃O₈ from 7.5 m
- CAP1081 7.5 m at 270 ppm eU₃O₈ from 3.5 m
- CAP0103 3.5 m at 438 ppm eU₃O₈ from surface

- ❖ Marenica drilling is testing exploration targets outside of the known resource area.
Significant intersection:

- MAR2289 12.0 m at 439 ppm eU₃O₈ from 14 m

Elevate Uranium Limited (“Elevate Uranium”, or the “Company”) (ASX:EL8) (OTC:ELVUF) is pleased to provide an update on pre-development and exploration activities in progress across its Namibian project portfolio.

Elevate Uranium's Managing Director, Murray Hill, commented:

*"Elevate Uranium is focussed on proving the benefits of its **U-pgrade™** beneficiation process as it progresses towards development of the Koppies Project. Design and construction of an **U-pgrade™** demonstration plant will occur during the first half of CY2025 and the plant is planned to be operating in late CY2025. Meanwhile, we continue to record exciting drilling results across our Namibian portfolio. Drilling on the Koppies Project at Hirabeb has intersected mineralisation adjacent to the current resource area, and at Namib IV we continue to record impressive intervals from our infill program, where we are proving the extent of mineralisation identified by previous broad spaced exploration drilling programs.*

Impressive results are also being achieved from drilling at Capri from our infill drill program and from greenfields exploration outside the resource area at Marenica."

Koppies Bulk Sample - Metallurgical testwork

Six tonnes of uranium ore samples excavated from bulk test pits at the Koppies resource have been received in Perth for **U-pgrade™** bench scale metallurgical testwork. Detailed mineralogical analysis of each test pit sample is in progress, along with detailed bench scale testing of the primary composites. Progress results are expected during early 2025.

The results will be used to inform the design of components of the Koppies **U-pgrade™** Demonstration Plant.

Koppies **U-pgrade™** Demonstration Plant

The Company is running a process to identify appropriate engineering, design and construct firms in Australia, to construct the Koppies **U-pgrade™** Demonstration Plant. The Company is in discussion with several engineering firms and expects to award the engineering contract by the end of 2024.

The Company intends to construct the plant in Australia, containerise it and then ship it to Namibia for operation on Koppies resource ore, at scale and on a continuous basis. The plant is expected to be operating in Namibia during the late in CY2025

Hirabeb Resource

The Hirabeb maiden resource of 10.2 Mlb eU₃O₈ was estimated and announced to ASX on 9 October 2024 and the current drilling program is testing the extent of mineralisation outside of that resource area. The Hirabeb mineralisation is only 25 kilometres from the southern portion of the Koppies resource (see Figure 2) and is part of the Koppies Uranium Project.

The current program is targeting basement hosted mineralisation north and northwest of the main resource area. Mineralisation has been intersected 1.2 km north of the resource area with potential for further extensions. The area northwest of the resource is open, with drilling currently underway and expected to continue to early 2025.

The location of the holes drilled outside the resource area are shown in Figure 1 with notable mineralised intervals from the drilling summarised in Table 1, the full list of intervals is provided in Table 6 and the drill collar details provided in Table 7.

Figure 1 Hirabeb Grade Thickness Collar Locations Outside Resource Area

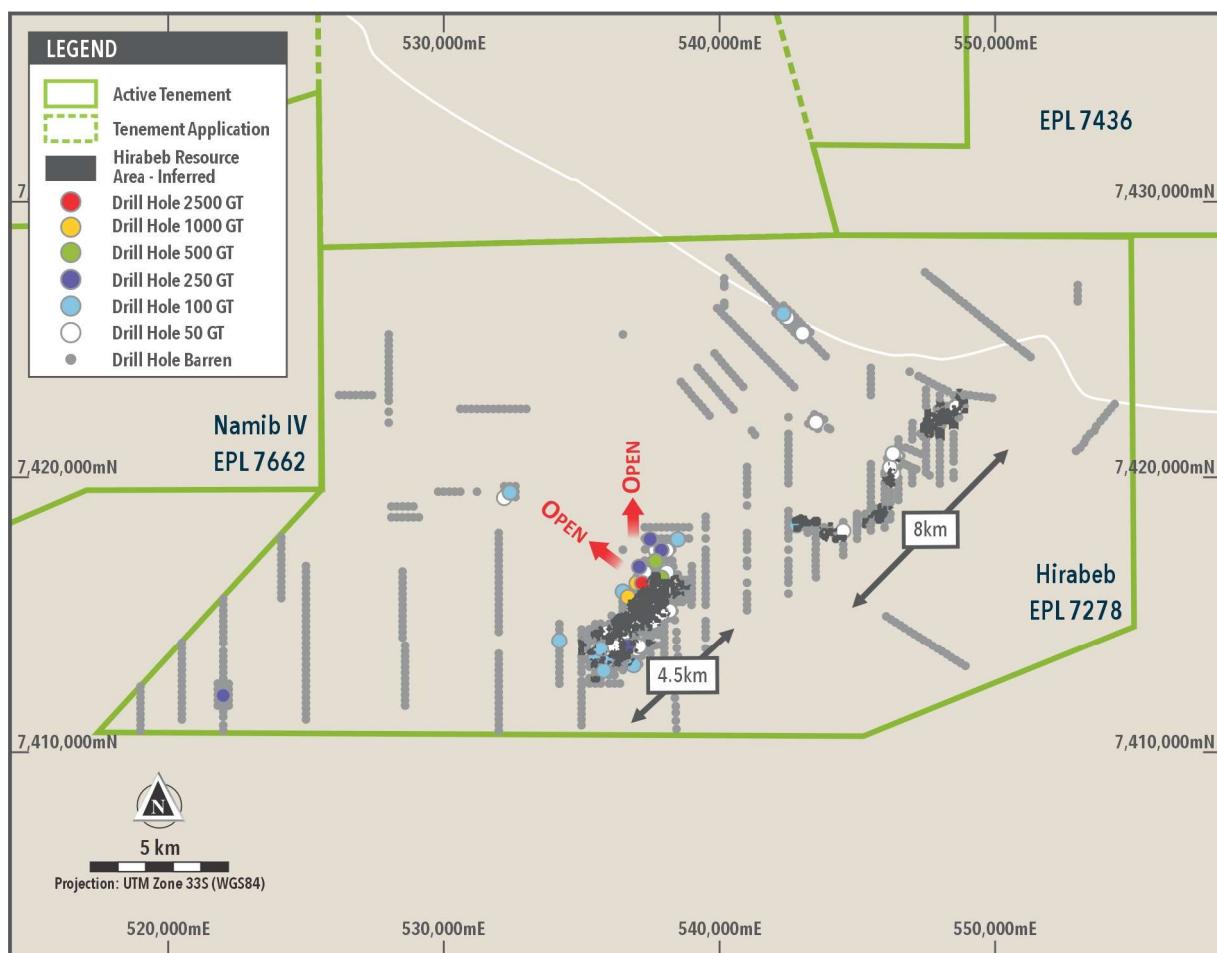

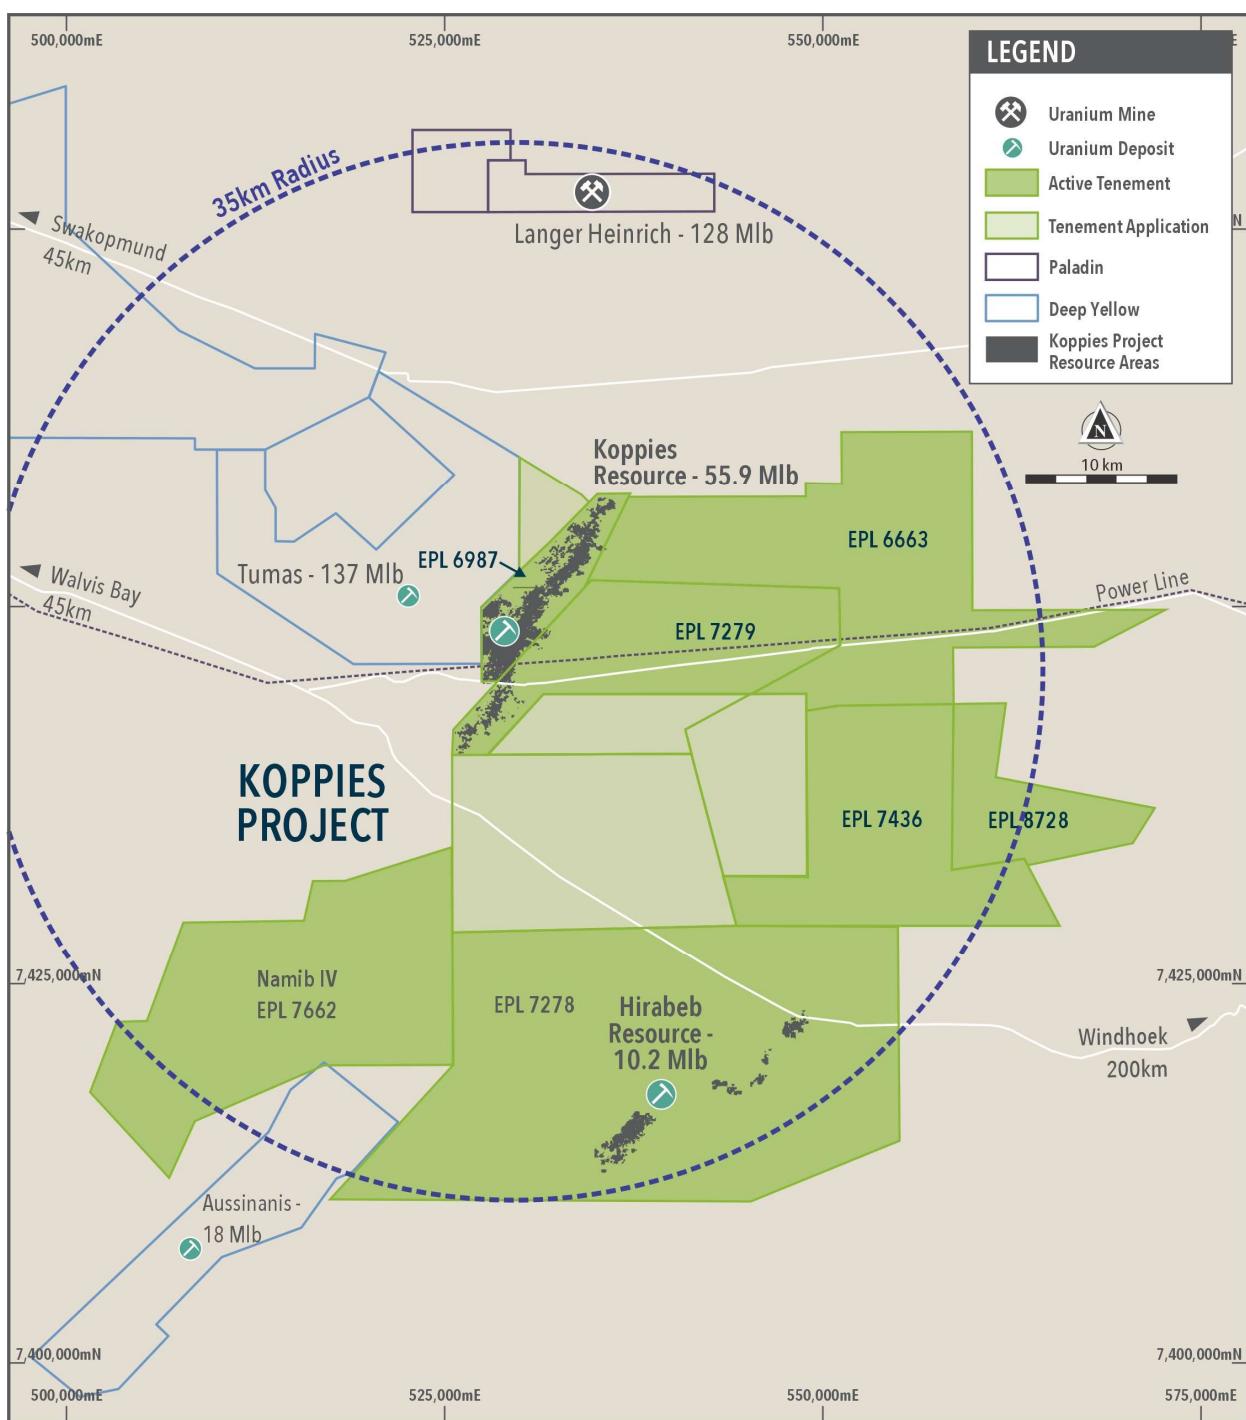

Table 1 Notable Hirabeb Intersections Greater Than 100 ppm eU₃O₈

Hole ID	From (m)	To (m)	Interval (m)	Grade U ₃ O ₈ (ppm)	Grade Thickness
HIR1751	25.5	27.5	2.0	545	1,090
HIR1757	26.0	28.0	2.0	280	560
HIR0126	12.0	14.0	2.0	219	438
HIR1730	9.0	10.5	1.5	292	438

The proximity of the Hirabeb resource within the Koppies Uranium Project is shown in Figure 2.

Figure 2 Koppies Project Area

Namib IV Tenement

The Namib IV mineralisation was discovered in 2021, however further exploration was deferred in favour of the Company's highly successful drilling programs to grow the Koppies resource. Exploration has now recommenced at Namib IV, with the strategy influenced by the experience gained from exploration of the basement hosted mineralisation encountered at Koppies. This approach is proving effective at Namib IV with a large area of continuous mineralisation now identified, see Figure 3.

The current drilling program is testing the extent of mineralisation by systematically stepping out with drill lines 400 m apart. Future in-fill drilling will be focused on confirming a mineralised polygon, with the aim of delineating and reporting a maiden resource during 2025.

Namib IV is only 20 kilometres from the southern portion of the Koppies resource (see Figure 2) and is part of the Koppies Uranium Project. As additional resources are delineated at Hirabeb and Namib IV they will add to the total Koppies Uranium Project resource base and may extend the life of mine or allow an increased production rate, at any future mining operation at Koppies.

The location of the drill holes are shown in Figure 3 with notable mineralised intervals summarised in Table 2. The full list of intervals is provided in Table 6 and the drill collar details provided in Table 7.

Figure 3 Namib IV Grade Thickness Collar Locations

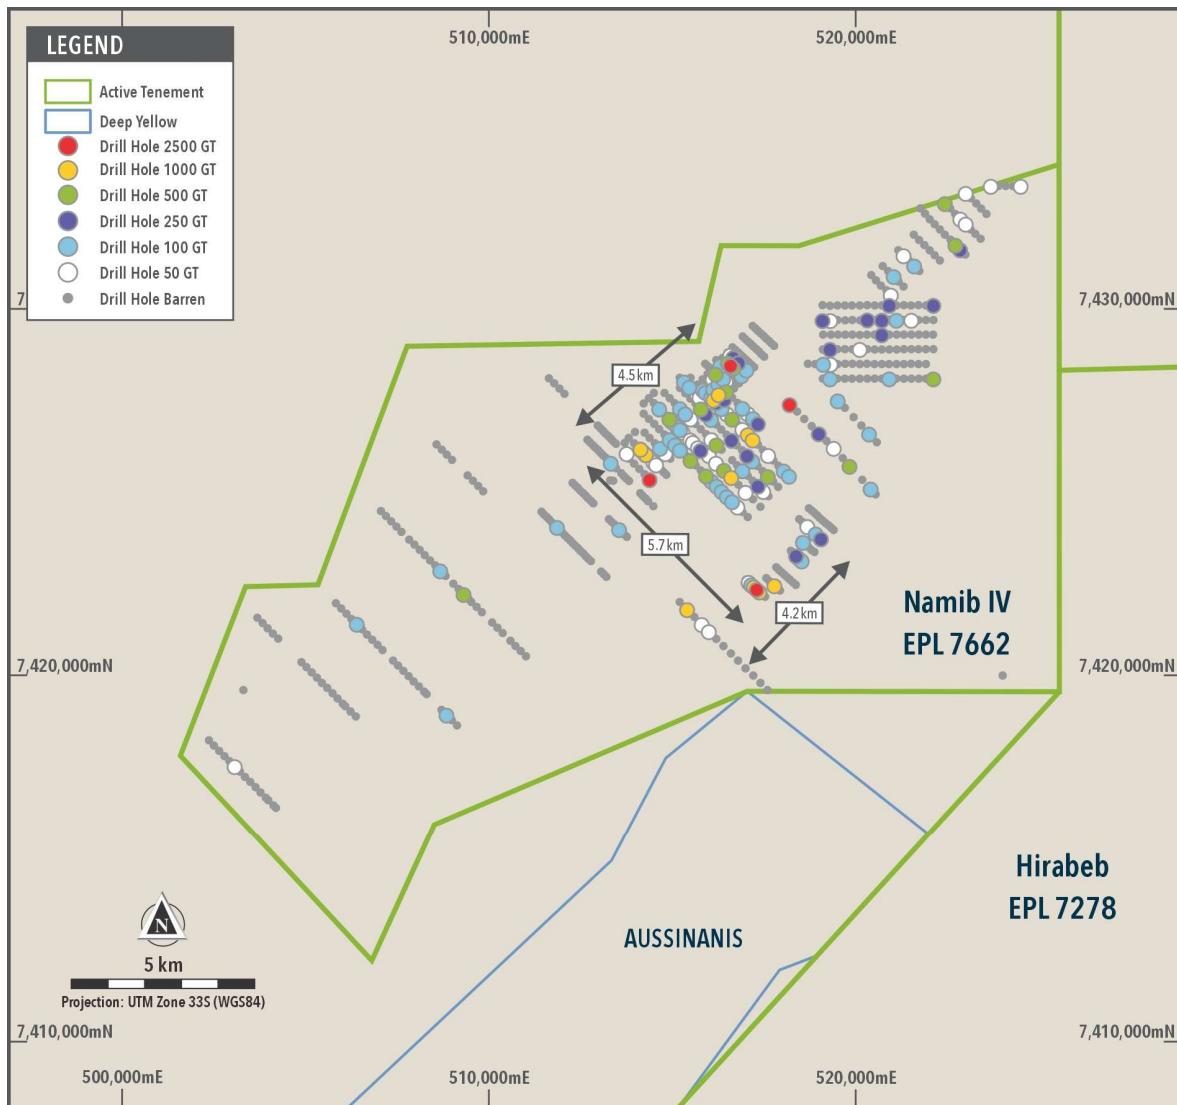

Table 2 Notable Namib IV Intersections Greater Than 100 ppm eU₃O₈

Hole ID	From (m)	To (m)	Interval (m)	Grade U ₃ O ₈ (ppm)	Grade Thickness
NIV0349	3.5	7.0	3.5	2,053	7,186
NIV0339	26.0	35.5	9.5	347	3,386
NIV007	3.0	11.0	8.0	364	2,912
N4R243	0.5	2.0	1.5	1,110	1,665
N4R046	0.5	3.5	3.0	535	1,605
N4R044	0.5	2.5	2.0	524	1,048
NIV0243	4.0	6.0	2.0	508	1,016
NIV0252	2.0	5.5	3.5	256	896
NIV0116	1.0	4.5	3.5	237	830
NIV0286	0.0	2.0	2.0	402	804
NIV0338	0.0	3.5	3.5	225	788
NIV0262	1.0	3.5	2.5	281	703
NIV0422	4.5	7.0	2.5	269	673
NIV0034	8.0	10.5	2.5	219	548
NIV0369	6.0	8.5	2.5	209	523

Note that 80% of the holes in Table 2 have mineralisation that commences within 4 m of surface, an indication that the bulk of the mineralisation will be shallow in depth, similar to that identified at the Koppies resource.

Capri Tenement

The Capri tenement is located only 25 kilometres from the Company's Marenica Uranium Project (see Figure 6).

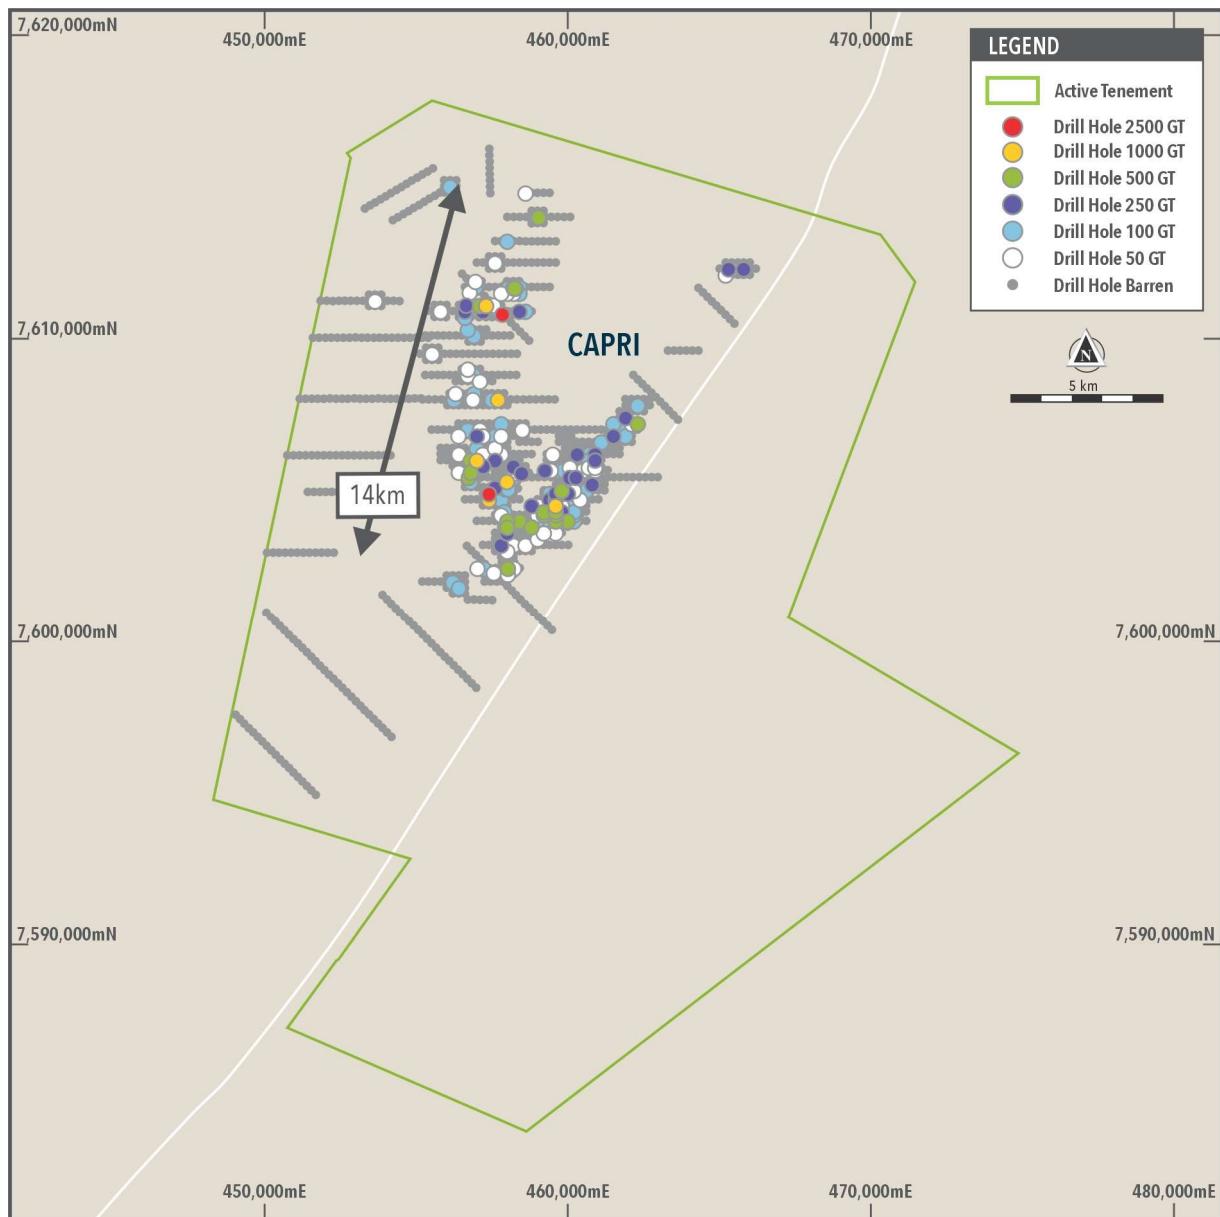

The latest phase of drilling has focused on the previously identified mineralised area and is designed to “close-up” the distance between drill lines from 800 to 2,500 metres apart, to nominally 200 metres apart. This infill drill program will better define the outline of the mineralisation with the aim of delineating and reporting a maiden resource during 2025.

Notable mineralised intervals from the drilling are summarised in Table 3 with the full list of intervals provided in Table 6 and the drill collar details provided in Table 7.

Table 3 Notable Capri Intersections Greater Than 100 ppm eU₃O₈

Hole ID	From (m)	To (m)	Interval (m)	Grade U ₃ O ₈ (ppm)	Grade Thickness
CAP0154	7.5	12.0	4.5	942	4,239
CAP1081	3.5	11.0	7.5	270	2,025
CAP0103	0.0	3.5	3.5	438	1,533
CAP1020	20.0	27.0	7.0	201	1,407

Figure 4 Capri Collar Grade Thickness Locations

Marenica Uranium Project

The Marenica Uranium Project is only 25 kilometres north of Orano's Trekkopje Uranium Project and only 25 km from the Company's Capri tenement (see Figure 6).

Drilling at Marenica commenced during the current quarter and was focused on exploration outside of the resource area. The drilling of an exploration target south of the MA7 deposit has identified some encouraging intersections with additional drilling in progress. The grade thickness of the holes drilled in 2024 are shown in Figure 5.

Notable mineralised intervals from the current drilling program are summarised in Table 4 with the full list of intervals provided in Table 6 and the drill collar details provided in Table 7.

Table 4 Notable Marenica Intersections Greater Than 100 ppm eU₃O₈

Hole ID	From (m)	To (m)	Interval (m)	Grade U ₃ O ₈ (ppm)	Grade Thickness
MAR2289	14.0	26.0	12.0	439	5,268

Competent Persons Statement – General Exploration Sign-Off

The information in this announcement that relates to exploration results, interpretations and conclusions, is based on and fairly represents information and supporting documentation reviewed by Mr Mark Menzies, who is a Member of the Australasian Institute of Geoscientists (AIG). Mr Menzies, who is an employee of the Company, has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person, as defined in the JORC 2012 edition of the “Australasian Code for Reporting of Mineral Resources and Ore Reserves”. Mr Menzies consents to the inclusion of this information in the form and context in which it appears.

Koppies Uranium Deposit:

The Company confirms that the Mineral Resource Estimate for the Koppies Project has not changed since the ASX announcement titled "Resource Upgrade Marks New Phase of Growth for Koppies Uranium Project", dated 9 October 2024. The Company is not aware of any new information, or data, that effects the information as disclosed in the announcement referred to above and confirms that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed.

Hirabeb Uranium Deposit:

The Company confirms that the Mineral Resource Estimate for the Hirabeb Uranium Deposit has not changed since the ASX announcement titled "Resource Upgrade Marks New Phase of Growth for Koppies Uranium Project", dated 9 October 2024. The Company is not aware of any new information, or data, that effects the information as disclosed in the announcement referred to above and confirms that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed.

Marenica Uranium Project:

The Company confirms that the Mineral Resource Estimates for the Marenica and MA7 deposits have not changed since the annual review disclosed in the 2024 Annual Report. The Company is not aware of any new information, or data, that effects the information in the 2024 Annual Report and confirms that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed. The Mineral Resource Estimates for the Marenica and MA7 deposits were prepared in accordance with the requirements of the JORC Code 2004. They have not been updated since to comply with the 2012 Edition of the Australian Code for the Reporting of Exploration Results, Minerals Resources and Ore Reserves ("JORC Code 2012") on the basis that the information has not materially changed since they were last reported. A Competent Person has not undertaken sufficient work to classify the estimate of the Mineral Resource in accordance with the JORC Code 2012; it is possible that following evaluation and/or further exploration work the currently reported estimate may materially change and hence will need to be reported afresh under and in accordance with the JORC Code 2012.

Australian Uranium Projects:

The Company confirms that the Mineral Resource Estimates for Angela, Thatcher Soak, Bigrlyi, Sundberg, Hill One, Karins, Walbiri and Malawiri have not changed since the annual review disclosed in the 2024 Annual Report. The Company is not aware of any new information, or data, that effects the information in the 2024 Annual Report and confirms that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed.

Note: all holes are drilled by RC, have an 0° azimuth and -90° dip.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<ul style="list-style-type: none"> • Uranium grade at Hirabeb, Namib IV, Marenica and Capri was estimated using downhole gamma probes. Some previous holes at Hirabeb have been analysed using wet chemical analysis at a commercial laboratory to check the downhole gamma grades. • Gamma probes provide an estimate of uranium grade in a volume extending approximately 40 cm from the hole and thus are more representative than wet chemical samples which represents a much smaller fraction of this volume. Gamma probes were calibrated at the Pelindaba facility in South Africa and at borehole Garc065 on the Bannerman EPL in Alaskite and Chuos Formation lithologies. • Gamma data (as counts per second) from calibrated probes are converted into equivalent uranium values (eU_3O_8) using appropriate calibration, water and casing factors. Gamma probes can overestimate uranium grade if high thorium is present or if disequilibrium exists between uranium and its daughters. Neither is thought to be a significant issue here.
Drilling techniques	<ul style="list-style-type: none"> • Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> • Reverse circulation percussion (RC) was used. Hole diameter is approximately 140 mm. Holes are relatively shallow (typically 28 m) and vertical, therefore downhole dip and azimuth were not recorded.
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. 	<ul style="list-style-type: none"> • Bags containing 1 m of chip samples were weighed at the rig and weights recorded. The nominal weight of a 1 m sample is 25 kg and

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>recovery is assessed using the ratio of actual to ideal sample weight.</p> <ul style="list-style-type: none"> • Standard operating procedures are in place at the drill rig in order to ensure that sampling of the drilling chips is representative of the material being drilled. • In most cases grade is derived from gamma measurement and sample bias is not an issue. There is a possibility that some very fine uranium is lost during drilling, and this will be investigated by twinning some RC holes in a later campaign.
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> • Chip samples are visually logged to a basic level of detail. Parameters recorded include lithology, colour, sample condition (i.e. wet or dry) and total gamma count using a handheld scintillometer. • Logging is qualitative. Reference photographs are taken of RC chips in chip trays. • All samples were logged.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> • 1 m RC chips were subsampled to approximately 1 kg using a 3-way riffle or cone splitter mounted on the RC rig. A second 1 kg sample was collected as a field duplicate and reference sample. Samples were predominantly dry. • Samples for geochemical analysis, split and pulverised to 120g, were shipped to Intertek's preparation laboratory at Tschudi for crushing and grinding. • Certified reference material, duplicate samples and blank samples were submitted at a rate of 1 per 20. • Mineralisation is somewhat nuggety, however this is overcome by the use of gamma logging which measures a significantly larger volume. • This has not yet been investigated as the values used for interpretations are derived from downhole gamma logging.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, 	<ul style="list-style-type: none"> • Samples from limited holes at Hirabeb have been analysed by chemical analyses at Intertek state of the art facility in Perth, Australia using a sodium peroxide fusion and ICP-MS finish which measures total uranium content of the samples. This method produces precise and accurate data and has no known issues with respect to uranium analysis. • The gamma probes used have been checked against assays by

Criteria	JORC Code explanation	Commentary
	<p><i>the parameters used in determining the analysis including instrument make and model, reading times, calibration factors applied and their derivation, etc.</i></p> <ul style="list-style-type: none"> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<p>logging drill holes for which the Company has geochemical assays at Hirabeb. The comparison between geochemical assays and derived equivalent uranium values and deemed sufficient for use.</p> <ul style="list-style-type: none"> Review of the company's QA/QC sampling and analysis confirms that the analytical program has provided data with good analytical precision and accuracy. No external laboratory (i.e. umpire) checks have been undertaken.
Verification of sampling and assaying	<ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> No external verification has been undertaken to date. Holes have not been twinned at this time. Downhole gamma data are provided as LAS files by the company's geophysical logging contractor which are imported into the company's hosted Datashed 5 database where eU_3O_8 is calculated automatically. Data are stored on a secure server maintained by the database consultants, with data made available online. No adjustment undertaken.
Location of data points	<ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> Collar locations were surveyed using a differential GPS system. RL's were based on a Worldview 3 DEM and are accurate to better than 50 cm. No downhole surveys have been undertaken to date. The grid system is Universal Transverse Mercator, zone 33S (WGS 84 datum). Topographic control is provided by a digital elevation model derived from Worldview 3 imagery and is accurate to approximately 50 cm.
Data spacing and distribution	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> Drilling programs range from largely exploratory in nature, to closer spaced at regular intervals, and use a variety of drill spacings. Line spacing ranges from 200 m to 1600 m or more, with holes typically 200 m apart. Drilling is sufficient to broadly define a mineralised envelope, with closer spaced drilling required to establish geological and grade continuity sufficient for mineral resource estimation. Gamma measurements are taken every 10 cm downhole. These 10 cm measurements are composited to 0.5 m intervals.
Orientation of data in relation to	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation</i> 	<ul style="list-style-type: none"> Uranium mineralisation, although quite nuggety, is broadly distributed in moderately continuous horizontal layers. Holes are drilled vertically.

Criteria	JORC Code explanation	Commentary
geological structure	<i>of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	
Sample security	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> • Samples from mineralised intervals, determined from down hole gamma probe, as well as a second split (field duplicate) are collected in plastic bags and transported to Elevate's storage shed in Swakopmund by Company personnel where they are kept under lock and key. Samples selected for geochemical analysis are transported by a contract transport company in Swakopmund to the Genalysis Intertek sample preparation facility in Tschudi.
Audits or reviews	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> • No audits have been undertaken.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> • <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> • <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> • The Exploration Results for the Hirabeb Project relate to exclusive prospecting licence EPL 7278 "Hirabeb", owned 100% by Marenica Ventures Pty Ltd, a 100%-owned subsidiary company of Elevate Uranium Ltd. EPL 7278 was granted on 16 May 2019. An EPL renewal was lodged with the MME on 8 March 2024. • The Exploration Results for Namib IV relate to exclusive prospecting licence EPL 7662, owned 100% by Marenica Ventures Pty Ltd, a 100%-owned subsidiary company of Elevate Uranium Ltd. EPL 7662 was granted on 7 November 2019. The EPL was renewed on 27 November 2023 for a period of 2 years. • The Exploration Results for the Capri Project relate to exclusive prospecting licence EPL 7508 "Capri", owned 100% by Marenica Ventures Pty Ltd, a 100%-owned subsidiary company of Elevate Uranium Ltd. EPL 7508 was renewed on 2 March 2023 for a period of 2 years. • The Exploration Results for the Marenica Project relate to mineral deposit retention licence MDRL 3287, owned 75% by Marenica Energy Namibia Pty Ltd, a 100%-owned subsidiary company of Elevate Uranium Ltd. MDRL 3287 was renewed on 21 May 2023 for a period of 2 years.

Criteria	JORC Code explanation	Commentary
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> General Mining is known to have previously explored the area covered by the tenements in the late 1970's, however the results of this work are poorly documented but did include completion of a small number of drillholes.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> Uranium mineralisation occurs as secondary enrichment in calcretised sediment infilling palaeochannels, and within weathered bedrock. Uranium mineralisation is surficial, strata bound and hosted by Cenozoic and possibly Tertiary sediments, which include from top to bottom scree sand, gypcrete, calcareous sand and calcrete or within weathered basement rocks underlying the palaeochannel.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> 177 holes for a total of 4,966 m have been drilled at Hirabeb. 209 holes for a total of 5,875 m have been drilled at Namib IV. 475 holes for a total of 13,401 m have been drilled at Capri. 272 holes for a total of 8,086 m have been drilled at Marenica. All holes were drilled vertically and intersections measured present true thicknesses. Table 7 lists all the additional drill hole locations since the previous exploration drill programs reported on 25 July 2024.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> The reported grades have not been cut. All grade intervals are weighted averages over the stated interval. Not relevant.
Relationship between mineralisation widths and	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there 	<ul style="list-style-type: none"> The mineralisation is sub-horizontal and all drilling vertical, therefore, mineralised intercepts are considered to represent true widths. Not relevant.

Criteria	JORC Code explanation	Commentary
<i>intercept lengths</i>	<i>should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> Maps and sections are included in the text.
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> All drill collars and significant results are reported in this announcement.
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> Previous Drilling results have been reported in earlier announcements.
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> Exploration of early stage targets, regular spaced drilling to delineate zones of mineralisation, and Infill drilling of known mineralised regions will continue in 2025. See text.
