

Mata da Corda Delivers High-Grade Titanium with Niobium and Rare Earth Co-Product Potential

Substantial Titanium Intercept of 61.2m at 11.89% TiO₂ from Surface

Highlights

- **Exceptional TiO₂ Grades with Multi-Commodity at-Surface Potential:** Over 1,900 drill samples from the Mata da Corda Project reveal high-grade Titanium Dioxide (TiO₂) grades, averaging 10.23% with a standard deviation of 3.3%, demonstrating a consistent grade profile across the drilled project area and highlighting mineralisation continuity. High-grade titanium, Total Rare Earth Oxides (TREO), and Niobium Pentoxide (Nb₂O₅) intercepts are concentrated within 10–15 meters from the surface, indicating favorable potential development opportunities. With an average ore density of 1.78 t/m³ and strong correlations between TiO₂, Nb₂O₅, and TREO, TiO₂ emerges as the key economic driver, while Nb₂O₅ and TREO offer valuable co-product potential.
- Additional drilling results from **63 drill holes**, with an average depth of 18.8 meters has returned exceptional titanium dioxide (TiO₂) results all from surface. Standout intercepts include **12m at 15.32% TiO₂ (MC_AD24_081)**, **61.2m at 11.89% TiO₂ (MC_DD24_015)**, and **23.95m at 13.38% TiO₂ (MC_DD24_029)**. Notably, **298 intercepts exceed 10% TiO₂ across 504.8 meters from 43 drill holes**. Significant titanium dioxide intercepts include:
 - 12m at 15.32% TiO₂ from surface (MC_AD24_081)
 - 61.2m at 11.89% TiO₂ from surface (MC_DD24_015)
 - 12m at 15.20% TiO₂ from surface (MC_AD24_057)
 - 23.95m at 13.38% TiO₂ from surface (MC_DD24_029)
 - 10m at 14.98% TiO₂ from surface (MC_AD24_052)
 - 12m at 14.12% TiO₂ from surface (MC_AD24_056)
 - 37.3m at 12.66% TiO₂ from surface (MC_DD24_016)
 - 9m at 14.86% TiO₂ from surface (MC_AD24_048)
 - 12m at 13.41% TiO₂ from surface (MC_AD24_054)
 - 11m at 13.52% TiO₂ from surface (MC_AD24_061)
 - 12m at 12.77% TiO₂ from surface (MC_AD24_060)
 - 31.25m at 12.15% TiO₂ from surface (MC_DD24_017)
 - 26.9m at 11.81% TiO₂ from surface (MC_DD24_013)
 - 27.25m at 11.37% TiO₂ from surface (MC_DD24_012)
 - 14m at 11.23% TiO₂ from surface (MC_AD24_086)
 - 23.9m at 11.01% TiO₂ from surface (MC_DD24_010)
 - 37m at 12.07% TiO₂ from surface (MC_DD24_030)
 - 11m at 10.43% TiO₂ from surface (MC_AD24_033)

- Drilling results have delivered outstanding Total Rare Earth Oxide (TREO) intercepts, coupled with significant Magnetic Rare Earth Oxide (MREO) content. Highlights include **37.3m at 2400 ppm TREO with 23% MREO** (MC_DD24_030) and **37m at 2590 ppm TREO with 22% MREO** (MC_DD24_016). **106 intercepts exceed 3,000 ppm TREO totaling 178.3 meters** from 35 holes, with MREO percentages averaging 23%. Significant TREO intercepts include:
 - 37.3m at 2400 ppm TREO, 23% MREO from surface (MC_DD24_030)
 - 37m at 2590 ppm TREO, 22% MREO from surface (MC_DD24_016)
 - 26.9m at 2786 ppm TREO, 22% MREO from surface (MC_DD24_013)
 - 23.9m at 2514 ppm TREO, 23% MREO from surface (MC_DD24_010)
 - 15m at 2558 ppm TREO, 23% MREO from surface (MC_AD24_082)
 - 12m at 3789 ppm TREO, 22% MREO from surface (MC_AD24_081)
 - 12m at 3266 ppm TREO, 24% MREO from surface (MC_AD24_047)
 - 12m at 2931 ppm TREO, 22% MREO from surface (MC_AD24_057)
 - 12m at 2680 ppm TREO, 22% MREO from surface (MC_AD24_056)
 - 12m at 2667 ppm TREO, 22% MREO from surface (MC_AD24_054)
 - 11m at 3098 ppm TREO, 24% MREO from surface (MC_AD24_033)
 - 10m at 3237 ppm TREO, 25% MREO from surface (MC_AD24_023)
 - 10m at 2915 ppm TREO, 22% MREO from surface (MC_AD24_052)
 - 9m at 3538 ppm TREO, 23% MREO from surface (MC_AD24_048)
- Drilling has also confirmed significant niobium pentoxide mineralisation, exemplified by **12 m at 932 ppm Nb₂O₅** from surface (MC_AD24_056) and **26.9 m at 775 ppm Nb₂O₅** from surface (MC_DD24_013). **536 intercepts exceed 500 ppm Nb₂O₅**, from 70 drill holes accounting for **944 m** of mineralised drill intervals. Other notable niobium intercepts include:
 - 12m at 932 ppm Nb₂O₅ from surface (MC_AD24_056)
 - 12m at 929 ppm Nb₂O₅ from surface (MC_AD24_081)
 - 12m at 892 ppm Nb₂O₅ from surface (MC_AD24_057)
 - 10m at 884 ppm Nb₂O₅ from surface (MC_AD24_052)
 - 9m at 832 ppm Nb₂O₅ from surface (MC_AD24_048)
 - 11m at 824 ppm Nb₂O₅ from surface (MC_AD24_061)
 - 37m at 817 ppm Nb₂O₅ from surface (MC_DD24_016)
 - 12m at 785 ppm Nb₂O₅ from surface (MC_AD24_008)
 - 23.95m at 777 ppm Nb₂O₅ from surface (MC_DD24_029)
 - 26.9m at 775 ppm Nb₂O₅ from surface (MC_DD24_013)
 - 12m at 774 ppm Nb₂O₅ from surface (MC_AD24_054)
 - 15m at 765 ppm Nb₂O₅ from surface (MC_AD24_019)
- Drilling and test work underway aiming to deliver a maiden Mineral Resource Estimate H1 CY2025.

Equinox Resources Limited (ASX: EQN) ("Equinox Resources" or the "Company") is pleased to report exceptional results from its ongoing drilling campaign at the Mata da Corda multicommodity Project ("Project"), located in Minas Gerais, Brazil. This Project continues to demonstrate significant potential for multi-commodity mineralisation.

Equinox Resources Managing Director, Zac Komur, commented:

"These high-grade titanium intercepts, averaging 10.23% TiO₂ with a consistent grade profile and homogenous distribution, highlight the strong mineralisation continuity of the Mata da Corda Project. Combined with the potential for niobium and rare earth co-product credits, this district-scale discovery, staked just a year ago, marks a pivotal achievement. These latest results advance us toward our target of delivering our maiden Mineral Resource Estimate in H1 CY2025 and demonstrate the substantial value being built within our portfolio."

Exceptional TiO₂ grades and Multicommodity Potential

The latest results confirm high grade titanium dioxide (TiO₂) grades, while also indicating strong correlations with niobium pentoxide (Nb₂O₅) and total rare earth oxides (TREO). These results highlight the project's multi-commodity nature and strengthen its overall economic outlook.

An assay database comprising of over 1,900 drill samples demonstrates that a notable proportion exceeds a notional 5% TiO₂ cut-off (see Figure 1). With an average grade of 10.23% and a standard deviation of 3.3%, the TiO₂ results demonstrate a consistent grade profile across the project area, highlighting mineralisation continuity.

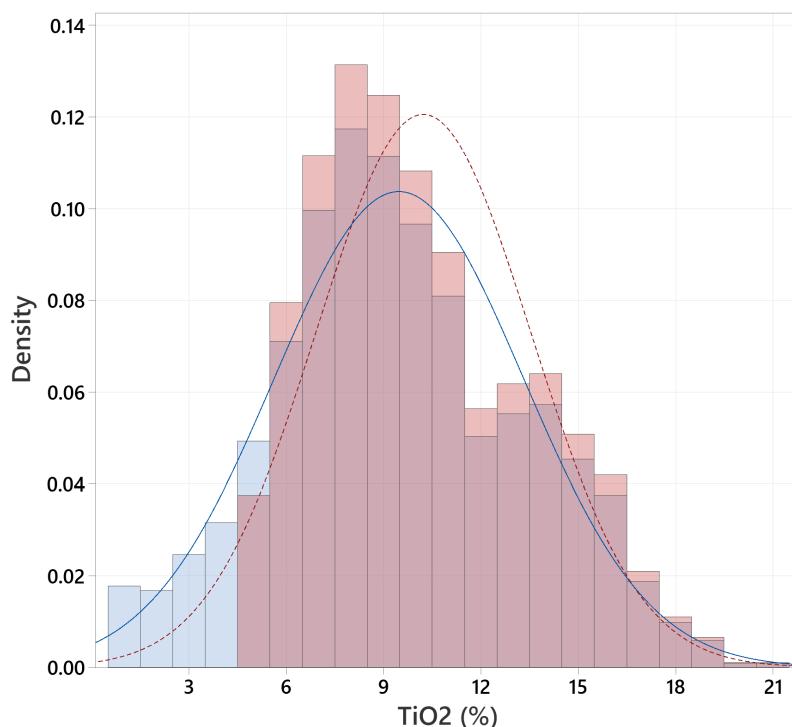

Figure 1: Histogram illustrating the distribution of TiO₂ assays from over 1,900 drilling samples, highlighting a notable peak around 9–10% TiO₂ and a significant proportion of assays exceeding a notional 5% cut-off grade.

A pronounced linear trend becomes evident when TiO_2 assay values are plotted against Nb_2O_5 (see **Figure 2**), indicating that higher titanium grades coincide with elevated niobium levels. Niobium is a critical element in high-strength steel alloys used across numerous industrial sectors, including transportation, pipeline infrastructure, and advanced engineering. The consistent co-occurrence of these commodities highlights the project's multi-commodity potential.

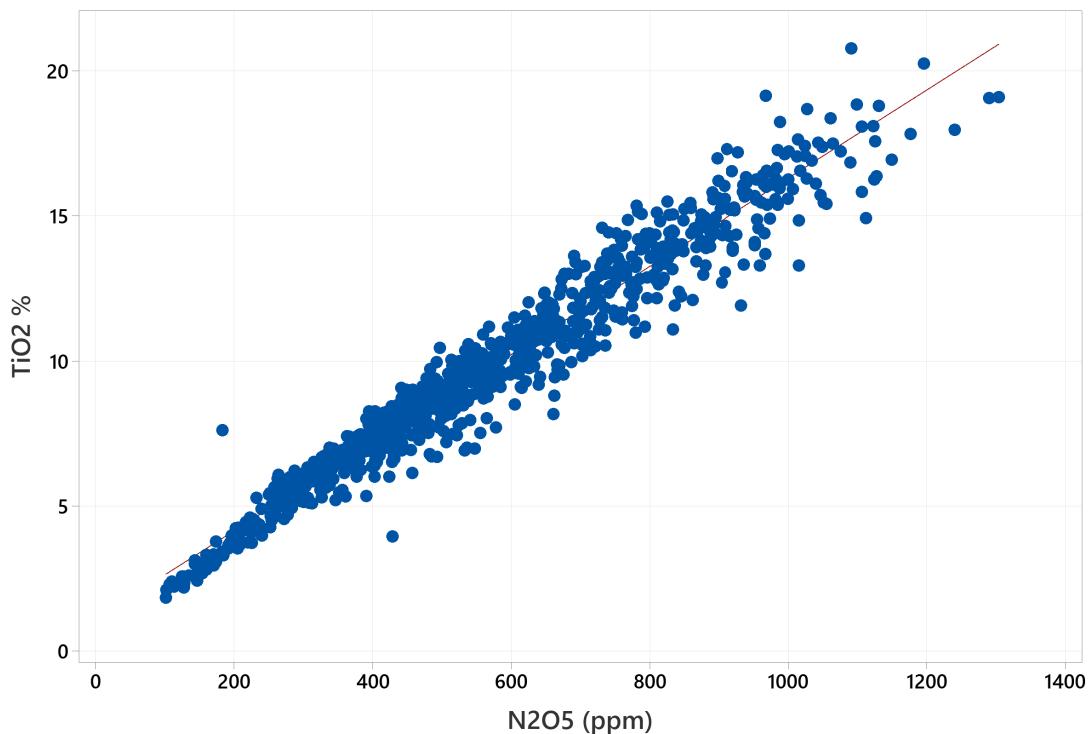

Figure 2: Scatter plot showing a strong positive correlation between TiO_2 and Nb_2O_5 values, demonstrating concurrent enrichment in both titanium and niobium.

A similar pattern emerges when TiO_2 is compared with TREO (see **Figure 3**), with higher titanium concentrations consistently coinciding with elevated rare earth oxide values. Their association alongside titanium and niobium underscores the Mata da Corda Project's notable multi-revenue potential.

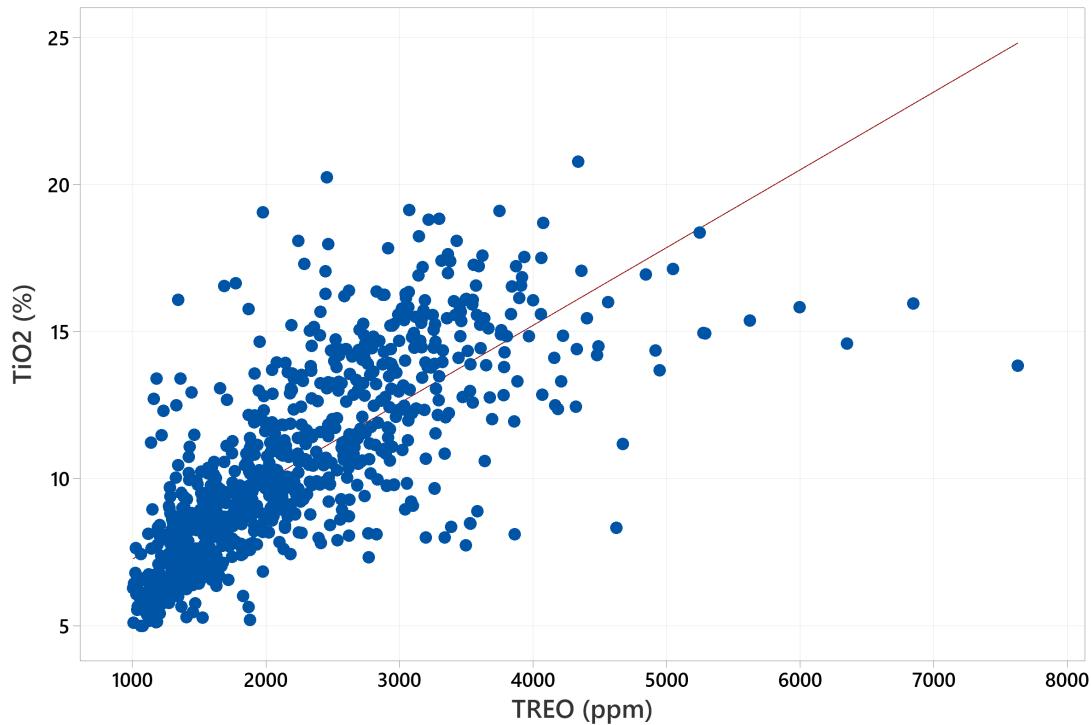

Figure 3: Scatter plot depicting the relationship between TiO_2 and TREO, indicating that higher titanium concentrations often coincide with elevated rare earth oxide grades.

The exploration programme at Mata da Corda continues to advance, with drilling aimed at defining high-grade mineralisation ahead of a maiden Mineral Resource Estimate, targeted for H1 CY2025. Current activities systematically target priority zones to provide the data necessary for robust resource modelling and future development planning.

In parallel, Equinox Resources is conducting mineral characterisation testwork on drill core, with an emphasis on the nature of titanium mineralisation. These analyses will inform the design of an optimal extraction flowsheet for titanium, while also facilitating the recovery of niobium (Nb_2O_5) and total rare earth oxides as co-products. Further drilling is planned to refine the spatial extent and continuity of mineralisation, and concurrent metallurgical studies will assess recovery characteristics for TiO_2 , Nb_2O_5 , and TREO.

Overall, Mata da Corda stands out as a significant titanium opportunity, enhanced by associated niobium and rare earth potential. This multi-commodity framework is particularly compelling given growing global demand for critical metals.

COMPETENT PERSON STATEMENT

Sergio Luiz Martins Pereira, the in-country Exploration Manager for Equinox Resources Limited, compiled and evaluated the technical information in this release and is a member of the Australian Institute of Geoscientists (MAIG, 2019, #7341), accepted to report in accordance with ASX listing rules. Sergio Luiz Martins Pereira has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australian Code for Reporting of Regulation, Exploration Results, Mineral Resources, and Ore Reserves'. Sergio Luiz Martins Pereira consents to including matters in the report based on information in the form and context in which it appears. The Company confirms that it is unaware of any new information or data that materially affects the information included in the market announcements referred to in this release and that all material assumptions and technical information referenced in the market announcement continue to apply and have not materially changed. All announcements referred to throughout can be found on the Company's website – eqnx.com.au.

COMPLIANCE STATEMENT

This announcement contains information on the Mata da Corda Project extracted from ASX market announcements dated 13 December 2023, 1 May 2024, 11 June 2024, 25 June 2024, 11 July 2024, 30 July 2024, 9 August 2024, 9 October 2024, 14 October 2024 and 25 November 2024. released by the Company and reported in accordance with the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (2012 JORC Code) and available for viewing at www.eqnx.com.au or www.asx.com.au. Equinox Resources is not aware of any new information or data that materially affects the information included in the original market announcement.

FORWARD LOOKING STATEMENTS

This announcement may contain certain forward-looking statements and projections. Such forward looking statements/projections are estimates for discussion purposes only and should not be relied upon. Forward looking statements/projections are inherently uncertain and may therefore differ materially from results ultimately achieved. Equinox Resources Limited does not make any representations and provides no warranties concerning the accuracy of the projections and disclaims any obligation to update or revise any forward-looking statements/projects based on new information, future events or otherwise except to the extent required by applicable laws. While the information contained in this report has been prepared in good faith, neither Equinox Resources Limited or any of its directors, officers, agents, employees, or advisors give any representation or warranty, express or implied, as to the fairness, accuracy, completeness or correctness of the information, opinions and conclusions contained in this announcement.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>Nature of Sampling: Mata da Corda Rare Earth Project was sampled using Diamond drilling (DD) and Auger Drilling (AD) were completed. Auger drilling was performed using a 3" diameter bit, to a maximum depth of 15 meters and DD drilling program was designed to penetrate the clay layers and test the depth and extent of the mineralisation. Sampling was conducted systematically with composites every 1 to 3 meters.</p> <p>Method of Collection: Samples from the AD and DD drilling were retrieved directly from drill core. Each sample was collected in pre-labeled plastic bags, immediately sealed to prevent contamination. The bags were clearly marked with unique identification numbers to maintain accurate traceability. After collecting, the samples were securely stored and prepared for shipment.</p> <p>Sample Care: Initial inspections of the AD and DD samples were conducted in the field by the project geologists to ensure the quality and integrity of the samples. Upon arrival at the storage facility, the samples underwent a second round of checks, including the review of drilling reports and the verification of sample labeling. Detailed logging of all drill holes was conducted, with an emphasis on recording geological information and ensuring the consistency of sample quality throughout the drilling process.</p> <p>Sample Weight: Each sample collected during the drilling program weighed between 4kg to 6kg, depending on the material and depth of the sample. This weight range provided a sufficient amount of material for laboratory analysis while preserving the integrity of the sample.</p> <p>Packaging & Labeling: After collection, the samples were placed in double plastic bags to prevent any contamination during handling and transport. Each bag was labeled with a unique identification number for traceability. The samples were securely sealed and shipped to SGS Laboratories in Belo Horizonte, Brazil, for preparation and analysis.</p>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> • <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<p>Type of Drill: A Diamond drill (DD) and Auger Drill (AD) was used for this stage of the exploration program.</p> <p>Drill Method: DD & AD drilling was implemented to collect continuous rock chips, which provided a representative sample from each meter of drilled material. This method is particularly effective for fast, efficient drilling in clay and rock formations, enabling comprehensive geological and geochemical analysis.</p> <p>Drill Rig: DD Sandvik UDR200 equipped with a H 76.2mm drill bit. This robust rig allowed for efficient penetration of the target zones while maintaining high-quality sample recovery across variable lithologies encountered in the drilling process.</p> <p>Drill Parameters: DD drilling was conducted to target depth ranging from 30 to 55 meters, depending on the specific target zones. AD was conducted to a maximum depth of 15 meters.</p> <p>Drill Orientation: Drilling was exclusively vertical, with no orientation monitoring deemed necessary due to the straightforward nature of the drilling method and the target zones.</p>

Criteria	JORC Code explanation	Commentary
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>Recovery Rates: DD drilling overall recovery was 80%. Each drilling session was documented, assuring thorough record-keeping.</p> <p>Recovery rates were calculated by comparing actual core or chip lengths with expected run lengths, and all data was logged immediately and precisely.</p> <p>Consistent drilling protocols, immediate secure packaging, and minimal handling were standard practices to optimize sample integrity and recovery.</p> <p>No significant bias was detected between sample recovery and grade, suggesting reliable assay data with minimal material loss or gain across varying grain sizes.</p> <p>Every meter sample was collected in plastic buckets and weighed. Each sample averages approximately 20kg, which is considered acceptable given the hole diameter and the specific density of the material.</p>
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	<p>Geological descriptions are made using a tablet with the MX Deposit system, which directly connects the geological descriptions to the database in the MX Deposit system managed by the Equinox Resources senior geologist.</p> <p>A geologist logs the material at the drill rig. Logging focuses on the soil (humic) horizon, saprolite/clay zones, and transition boundaries. Other parameters recorded include grain size, texture, and colour, which can help identify the parent rock before weathering.</p> <p>Due to the nature of the drilling, logging is done every meter. 1m samples weighing approximately 20kg are collected in a bucket and presented for sampling and logging.</p> <p>The chip trays of all drilled holes have a digital photographic record and are retained at the core facility in Patos de Minas.</p>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<p>Collection and Labeling: Samples of clayey soil, regolith, saprolite, and transitional material were collected 1 meter interval with composites prepared from 2 to 3 m intervals, placed in transparent plastic bags, sealed, and labelled.</p> <p>Weighing and Lab Analysis: The samples were weighed and sent for analysis.</p> <p>Sample Preparation at SGS Laboratories: - Dried at 60°C, Fresh rock was crushed to sub 2mm, Saprolite was disaggregated with hammers and Riffle split to obtain an 800g sub-sample. The sub-sample was pulverised to 85% passing 75um, monitored by sieving. Aliquot selection from the pulp packet.</p> <p>Analysis (ICP95A): The aliquot analyse Rare Earth Elements and Trace Elements by ICP-MS for 45 elements using fusion with lithium borate.</p>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and 	<p>Laboratory: All assay tests for the surface samples were conducted by the ALS laboratory:</p> <p>Lithium Borate Fusion followed by Inductively Coupled Plasma Mass Spectrometry (ICP95A) was employed to determine concentrations of Rare Earth elements. Detection limits for some elements include:</p> <p>a)</p>

Criteria	JORC Code explanation	Commentary																																																			
	<p><i>model, reading times, calibrations factors applied and their derivation, etc.</i></p> <ul style="list-style-type: none"> • <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<p>Ba 0.5 - 10000 (ppm) Ce 0.1 - 10000 (ppm) Rb 0.2 - 10000 (ppm) Cr 5 - 10000 (ppm) Sc 0.5 - 1000 (ppm) Cs 0.01 - 1000 (ppm) Sm 0.03 - 1000 (ppm) Dy 0.05 - 1000 (ppm) Sn 0.5 - 1000 (ppm) Er 0.03 - 1000 (ppm) Sr 0.1 - 1000 (ppm) Eu 0.02 - 1000 (ppm) Ta 0.1 - 10000 (ppm) Ga 0.1 - 10000 (ppm) Tb 0.01 - 1000 (ppm) Gd 0.05 - 1000 (ppm) Th 0.05 - 10000 (ppm) Hf 0.05 - 500 (ppm) Ti 0.01 - 10 (%) Ho 0.01 - 1000 (ppm) Tm 0.01 - 1000 (ppm) La 0.1 - 10000 (ppm) U 0.05 - 10000 (ppm) Lu 0.01 - 1000 (ppm) V 5 - 10000 (ppm) Nb 0.05 - 1000 (ppm) W 0.5 - 10000 (ppm) Nd 0.1 - 10000 (ppm) Y 0.1 - 10000 (ppm) Pr 0.02 - 1000 (ppm) Yb 0.03 - 1000 (ppm) Zr 1 - 10000 (ppm)</p> <p>b) Lithium Borate Fusion followed by Inductively Coupled Plasma Atomic Emission Spectrometry (ICP AES) was employed to determine concentrations of Major Oxides. Criteria	JORC Code explanation	Commentary
<i>Location of data points</i>	<ul style="list-style-type: none"> • Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control. 	<p>The UTM SIRGAS2000 zone 23S grid datum is used for current reporting. The samples collected are currently controlled by hand-held GPS with 4 m precision.</p> <p>The grid system employed for the project is based on the SIRGAS 2000 UTM coordinate system. This universal grid system facilitates consistent data interpretation and integration with other geospatial datasets.</p> <p>To ensure the quality and reliability of the topographic location data, benchmark and control points were established within the project area.</p>
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> • Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied. 	<p>This was an exploratory AD and DD program across the Mata da Corda tenements. The exploratory nature of the DD further supports the overall geological understanding, although its data spacing is not predefined.</p>
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> • Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<p>All drill holes were vertically oriented, the distribution of REE in the regolith horizons is largely controlled by vertical changes within the profile. Vertical drill holes intersect these horizons perpendicularly and obtain representative samples that reflect the true width of horizontal mineralization. In regolith, reverse circulation drill hole orientations do not result in geometrically biased interval thickness.</p> <p>Given the vast area extent and its relatively consistent thickness, vertical drilling is best suited to achieve unbiased sampling. This orientation allows for consistent intersecting of the horizontal mineralized zones and provides a representative view of the overall geology and mineralization.</p> <p>There is no indication that the orientation of the drilling has introduced any sampling bias about the crucial mineralized structures. The drilling orientation aligns well with the known geology of the deposit, ensuring accurate representation and unbiased sampling of the mineralized zones. Any potential bias due to drilling orientation is considered negligible in this context.</p>
<i>Sample security</i>	<ul style="list-style-type: none"> • The measures taken to ensure sample security. 	<p>After collecting in the field, the reverse circulation drill samples were placed in sealed plastic bags that were then placed into larger polyweave bags labelled with the sample IDs inside and transported to the Company's secure warehouse. Drill core samples were transported in their core boxes.</p> <p>The samples were transported directly to the SGS laboratories in Brazil. The samples were secured during transportation to ensure no tampering, contamination, or loss. The chain of custody was maintained from the field to the laboratory, with proper documentation accompanying each batch of samples to ensure transparency and traceability of the entire sampling process. Using a reputable laboratory further reinforces the sample security and integrity of the assay results.</p>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> • The results of any audits or reviews of sampling techniques and data. 	<p>As of the current reporting date, no external audits or reviews have been conducted on the sampling techniques, assay data, or results obtained from this work. However, internal processes and checks were carried out consistently to ensure the quality and reliability of the data.</p>

Section 2 Reporting of Exploration Results

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> • Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<p>The Mata da Corda Project is 100% owned by, Equinox Resources Limited (EQN), an Australian registered company.</p> <p>Located in the State of Minas Gerais, 400km from Belo Horizonte, along the Paranaíba River in south-eastern Brazil. Tenements consists of 57 granted exploration permits covering a land area of approximately 972.46 km². Permits are registered at Brazil's Agencia Nacional de Mineracao (ANM).</p>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> • Acknowledgment and appraisal of exploration by other parties. 	<p>No other exploration is known apart from the government agency's field mapping and geophysical data work.</p>
<i>Geology</i>	<ul style="list-style-type: none"> • Deposit type, geological setting and style of mineralisation. 	<p>The Mata da Corda Group occupies an extensive plain of approximately 2,200 square kilometers on the eastern flank of the Arco do Alto Paranaíba.</p> <p>This area is characterized by having rocks with kamafugitic affinity that appear in the form of subvolcanic plugs, volcanic flows and pyroclastic deposits (Patos Formation) and epiclastic deposits (Capaceté Formation), with a predominance of explosive rocks (Seer et al., 1989).</p> <p>The entire plateau is covered in iron-rich, predominantly clayey weathered soil, making it highly fertile for agriculture. Laterite crusts are common in the landscape.</p> <p>From a geological point of view, volcanism in the region occurred in multiple pulses, as evidenced by the recurrent presence of pyroclastic levels, including tuffs, lapillites and breccias. rocks with kamafugitic affinity include mafurites and ugandites, which are ultrabasic rocks, characterised by the presence of feldspathoids instead of feldspars, in addition to abundant clinopyroxene, titanomagnetite and perovskite (Takehara, 2015).</p>
<i>Drill hole Information</i>	<ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> ○ easting and northing of the drill hole collar ○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<p>The details related to all the AD and DD drill holes presented in this Report are detailed in Annex 1.</p>
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure 	<p>Data collected for this project includes surface geochemical analyses, geological mapping, drilling results. Data were compiled without selective exclusion. All analytical methods and aggregation were done according to industry best practices, as detailed in previous discussions.</p>

Criteria	JORC Code explanation	Commentary
	<p><i>used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <ul style="list-style-type: none"> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> 	<p>Given the nature of the deposit, which is a supergene deposit with a much larger area extent than its thickness, the vertical drilling orientation is suitable for accurately representing the mineralized zones.</p> <p>All drill holes are vertical and are appropriate for the deposit type, ensuring unbiased sampling of the mineralization.</p> <p>Due to the geometry of the mineralization and the vertical orientation of the drill holes, the down hole lengths can be considered close representations of the true widths of the mineralized zones. However, for absolute precision, further studies would be required.</p> <p>In cases where there might be a discrepancy between downhole lengths and true widths, it should be noted that "down hole length, true width not known".</p>
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<p>Diagrams, tables, and any graphic visualization are presented in the body of the report.</p>
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<p>The report presents all drilling results that are material to the project and are consistent with the JORC guidelines. This report is a faithful representation of the exploration activities and findings without any undue bias or omission.</p> <p>Assay results reported do not include the company's internal QA/QC samples taken as per industry standard practices.</p>
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<p>There is no additional substantive exploration data to report currently.</p>
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<p>Future works include further auger and diamond drilling campaign is underway across the project area including, geological mapping, geochemical and metallurgical tests, and mineralogical characterization.</p>
