

ASX ANNOUNCEMENT

19 March 2025

High-Priority Drill Target Identified at Nyungu South

HIGHLIGHTS:

- Nyungu South forms the southern end of the extensive 16km-long Nyungu 'Corridor' in the western part of the Mumbesghi tenure, with no current Exploration Target defined.
- Termite hill sampling, coincident with chargeable IP anomaly at Nyungu South has defined a cohesive 400m x 400m undrilled bullseye geochemical anomaly, 3km south of the flagship Nyungu Central deposit.
- Clear scale potential and multi-factor prospectivity establish it as a priority target for the Phase 2 drilling campaign at Mumbesghi, set to commence in Q2 2025.
- The Nyungu 'Corridor' contains multiple high-potential IP targets along its length, including Nyungu Central.
- Termite hill geochemical sampling, a reliable exploration tool utilised within the Zambian Copper Belt is ongoing, and delivering valuable data during the wet season.
- Comprehensive structural geology report for the Nyungu Central mineralisation is being compiled by Copper Belt specialists Tect Consulting, after a field visit last month.
- Recently released maiden Mumbesghi Mineral Resource estimate (107.2Mt @ 0.5% Cu) encompassed only the Nyungu Central and Kabikupa deposits (refer PSC ASX release dated 11 March 2025, *Mumbesghi Mineral Resources Exceed 500kt Contained Copper*).

Prospect Resources Limited (ASX:PSC) (**Prospect** or the **Company**) is pleased to provide an update of exploration activities at its Mumbesghi Copper Project (85% Prospect) in north-west Zambia (**Mumbesghi**).

Prospect's Managing Director and CEO, Sam Hosack, commented:

"The high-quality field work being undertaken by our geological team during the Zambian wet season continues to deliver excellent results in the lead up to commencement of our Phase 2 drilling at Mumbesghi. The identification of this bullseye geochemical anomaly, directly overlaying a recently identified chargeable IP anomaly in this new target area of Nyungu South, delivers further validation of the strong prospectivity of this target, and its high-priority status for drill testing. We are excited about getting the rigs turning again next quarter and testing this region, along with the other high-potential targets we have generated, including within the Nyungu North and West Mwombesghi Prospect areas."

High-potential target defined at Nyungu South

The Nyungu South prospect, covering about 1km of north-south strike and centred approximately 3km south-southwest of the key Nyungu Central deposit, was not targeted by Prospect in its 2024 Induced Polarisation (**IP**) survey work. However, recent re-evaluation of the historical Anglo American IP data (refer Prospect ASX release dated 6 March 2025) identified several interesting chargeable anomalies that were not drill targeted effectively by any previous owners of Mumbesghi (including at Nyungu South).

Previous testing with only 10 drillholes for approximately 1,730 metres by Argonaut Resources NL in 2012 (refer Prospect ASX release dated 17 June 2024) missed the latent prospectivity at the northern extent of Nyungu South's chargeable IP anomaly. Those holes were informed by the Anglo IP and surface geochemical soil data available at the time. However, Prospect's recent re-interpretation of the Anglo IP data indicates a far more extensive chargeable anomaly (over 600m in length), centred approximately 1km north of the area originally targeted by the Argonaut (see Figure 1).

Figure 1: Strongly chargeable Anglo IP anomaly located over Nyungu South, showing historical 2012 drilling (field of view is 1.5km looking northwest) and undrilled target (orange ellipse)

During February 2025, field teams at Mumbezhi completed a comprehensive termite hill sampling programme over a 6 square kilometre area covering the entire expanse of the Nyungu South Anglo chargeable IP anomaly.

Of the 1,213 termite hill samples collected from Nyungu South (see Figure 2 for locations), 65 samples were anomalous (≥ 150 ppm Cu), with 30 samples being highly anomalous (≥ 200 ppm Cu), peaking at 442 ppm Cu (Appendix 1 tables actual sample locations and Cu assays obtained from pXRF assaying of the dried samples).

Figure 2: Location map of termite hill sample locations and Cu grades for Nyungu South

What becomes immediately apparent is that the area of the historical 2012 drilling conducted by Argonaut, whilst clearly showing up as a weak anomaly of elevated Cu geochemical grades from the termite hill sampling, does not represent the main targets defined (Figure 2).

A 400m x 400m bulleye geochemical Cu anomaly centred about 1km north northwest of the 2012 drilling, has been interpreted by Prospect as a new walk-up drilling target for the Phase 2 programme in an undrilled area, and is strongly supported by both the chargeable IP data and a coherent Cu anomaly, defined by the recent sampling programme.

Another set of cohesive Cu assays ("New Structural Zone" in Figure 2) appears to trend from southwest to northeast on the southwestern section of the termite hill sampling area, and this is associated with high resistivity in the IP survey, which is currently interpreted to represent a structurally controlled zone, with potential leakage of mobile Cu mineralisation up fault planes – a lower priority drill target.

Figure 3: Termite hill geochemical sampling underway at Nyungu South Prospect

As Nyungu South is interpreted to represent the same geological and structural package as that characterised at Nyungu Central to the north, it has always been considered an important and prospective supplementary regional copper resource opportunity at Mumbhezhi, due to its proximity to the flagship deposit. The re-interpreted Anglo IP and supporting Cu termite hill geochemical sampling provides for a compelling new drill target at Nyungu South, in much the same fashion as was defined and then successfully drilled by the Company at Kabikupa last year.

Prospect believes that the combination of subsurface 3D generated geophysical IP data sets, in combination with coincident and comprehensive termite hill geochemical sampling, is now proving to be a very cost-effective and relatively quick exploration tool for assessing the Cu prospectivity at Mumbhezhi, and by extension, a useful method for prioritising drill targeting across the broader tenure.

Field exploration teams have now mobilised to complete geochemical sampling over the strike extensional areas adjacent to Nyungu Central, infill work at Nyungu North and then to West Mwombhezhi, targeting the prospective chargeable and resistivity IP anomalies defined there.

Results of this exploratory field work will be reported when collated and finalised.

Mumbhezhi Phase 2 drill programme planning

Prospect plans to commence its Phase 2 drilling programme at Mumbhezhi during Q2 2025, comprising principally diamond core drilling, and is set to target Mineral Resource expansion work

at the existing Nyungu Central and Kabikupa deposits (for which a maiden Mineral Resource estimate was recently declared).

A comprehensive programme of first-pass, exploratory scout drilling is also planned to be undertaken at the large Nyungu North and West Mwombezhi targets.

The new drilling targets defined at Nyungu South (this release) and extensions to Nyungu Central (Prospect ASX release 6 March 2025), will also undergo exploratory drilling in 2025 and represent potential additions to the existing Mineral Resource inventory estimated for Mumbezhi.

In this sense, Prospect's multi-disciplinary approach, with a strong emphasis on detailed structural modelling, integration of airborne geophysical data, geophysical IP data and historical soil sample data, followed up by termite hill geochemical sampling, is providing a clear path to defining quality Phase 2 growth drilling targets.

Some of the Phase 2 drilling will be directed towards specific technical and metallurgical drilling campaigns in support of a JORC-reportable Scoping Study which is scheduled for completion by the end of 2025.

Metallurgical work is being completed on a drill hole completed in October 2024 through the Nyungu Central deposit, with results expected in May.

Prospect is also accessing existing drill core from the Kabikupa deposit, to complete some initial desktop metallurgical test work on that Mineral Resource, with preliminary results expected during Q2 2025.

Structural Geology Report for Nyungu Central

A detailed geology and structural report for the main Nyungu Central copper mineralisation is expected next month from Tect Consultants, who have worked throughout the African Copper Belt and are considered industry experts in the genesis of this style of large, sedimentary-hosted copper deposition.

Competent Person's Statement

The information in this announcement that relates to Exploration Results, is based on information compiled by Mr Roger Tyler, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy (MAusIMM) and The South African Institute of Mining and Metallurgy. Mr Tyler is the Company's Chief Geologist. Mr Tyler has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a Competent Person (CP) as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Tyler consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Prospect confirms it is not aware of any new information or data which materially affects the information included in the original market announcements. Prospect confirms the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Caution Regarding Forward-Looking Information

This announcement may contain some references to forecasts, estimates, assumptions, and other forward-looking statements. Although the Company believes that its expectations, estimates and forecast outcomes are based on reasonable assumptions, it can give no assurance that they will be achieved. They may be affected by a variety of variables and changes in underlying assumptions that are subject to risk factors associated with the nature of the business, which could cause actual results to differ materially from those expressed herein. All references to dollars (\$) and cents in this announcement are in Australian currency, unless otherwise stated. Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities.

About Prospect Resources Limited (ASX: PSC, FRA:5E8)

Prospect Resources Limited (ASX: PSC, FRA:5E8) is an ASX listed company focused on the exploration and development of electrification and battery metals mining projects in the broader sub-Saharan African region.

About the Mumbezhi Copper Project

The Mumbezhi Copper Project (85% Prospect) (**Mumbezhi**) is situated in the world-class Central African Copperbelt region of north-western Zambia. Located on two granted Large Scale Mining Licences (39445-HQ-LML; 39465-HQ-LML), the project covers approximately 356 square kilometres of highly prospective tenure which lies in close proximity to several major mines which are hosted in similar geological settings.

Prospect's Phase 1 drilling programme at Mumbezhi ran from July to December 2024, and was primarily aimed at extending the mineralised footprint for the key Nyungu Central deposit, along strike, down dip to the west and down plunge of the historically defined, sedimentary-hosted Cu mineralisation.

The programme returned highly encouraging results, validating the growth potential of the significant endowment of copper mineralisation at Nyungu Central and delivering further confidence in a potential future development at Mumbezhi, underwriting a large-scale, open pit mining operation in a mining-friendly jurisdiction.

About Copper

Copper is a red-orange coloured metallic element in its pure form. It is highly conductive to heat and electricity, and is physically soft and malleable. Copper has been used for various purposes dating back at least 10,000 years. Today, it is mostly used by the electrical industry to make wires, cables, and other electronic components and is the key component. The metal is widely seen as a green-energy transition material, in part because of the wiring needed for electric cars. EVs can use up to 80kg of copper, four times the amount typically used in combustion engine vehicles.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	- Handheld XRF measurements were taken on termite hill samples, using an Innovx Vanta C. - The samples of approximate mass 2.5kg were collected in pre-numbered polywoven bags and then dried, sieved to -0.5mm, before the pXRF analyses. - All analyses were completed by Prospect on site. - A total of 1,213 geochemical samples were collected from Nyungu South, with soil colour, termite hill height and general vegetation at each sample site also recorded. - See Appendix 1 for all termite hill geochemical sampling locations conducted at the Nyungu South Prospect reported in this ASX Announcement.
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Drilling is not being reported in this ASX release.
Drill sample recovery	- Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative	Drilling is not being reported in this ASX release.

	nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. - The total length and percentage of the relevant intersections logged.	Drilling is not being reported in this ASX release.
Sub-sampling techniques and sample preparation	- If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality, and appropriateness of the sample preparation technique. - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	- Drilling is not being reported in this ASX release. 5% of Nyungu South geochemical samples are field duplicates.
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (eg standards, blanks,	- Drilling is not being reported in this ASX release. 5% of geochemical samples from Nyungu South are field duplicates and 5% low grade CRMs, produced by AMIS, notably 0433 (150ppm Cu).

	duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	
Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	• Drilling is not being reported in this ASX release. • Termite hill geochemistry values are of a higher tenor, but largely coincident with elevated historical Argonaut soil values. This is thought largely to be a function of the termite hill samples providing a better defined geochemical anomaly over deeper buried deposits. • 5% of all samples were split as duplicates in the field, and tested independently.
Location of data points	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• Drilling is not being reported in this ASX release. • The current geochemical sampling sites at Nyungu South were located by handheld Garmin 62. The co-ordinate system used is WGS UTM Zone 35S.
Data spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• Sampling spacing is subject to the natural distribution of termite hills, although approximate sampling grid of 50m was broadly maintained.
Orientation of data in relation to geological structure	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• Drilling is not being reported in this ASX release.
Sample security	• The measures taken to ensure sample security.	• All samples were collected by a senior technician or geologist and

		transported to the company's sample preparation and drying area at its secure on-site core yard.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No recent audits.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	- The initial Large Scale Prospecting Licence, 16121-HQ-LPL, for Mumbezhi, (formerly Lumwana West) is located approximately 100 km west of Solwezi, Zambia. The licence was due to expire on 20/07/2018 and was subsequently renewed as Large-Scale Exploration Licence, 22399-HQ-LEL on 29/12/2017, which was due to expire on 28/12/2021. - This latter tenement was revoked, and a similar ground position is now covered by 30426-HQ-LEL, granted for 4 years to Global Development Corporation (GDC) Consulting Zambia Limited on 02/12/2021, expiring on 01/12/2025. - GDC held 100% of the 30426-HQ-LEL (now 356 sq km). The licence excludes the northeast portion of the former licence, which incorporated the historic LMW and Kavipopo prospects. - Following the signing of the deal on 29th May 2024, PSC has acquired 85% of the project from GDC, with the licence now held under the name Osprey Resources Limited (85% PSC, 15% GDC). 30426-HQ-LEL was converted into two 25-year term Large Scale Mining Licences in March 2025, with Mumbezhi North (39445-HQ-LML) having an area of 137.59 sq km and Mumbezhi South (39465-HQ-LML) having an area of 218.01 sq km.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	- Roan Selection Trust (1960's-1970's) completed regional soil sampling, augering, wagon drilling and diamond drilling. Drilling completed at Nyungu (Drillholes MM295 and MM296). - AGIP-COGEA JV (1982-1987) - Systematic regional radiometric traversing, soil and stream sediment sampling, geological mapping, pitting and trenching, largely targeting the uranium

potential. No drilling was completed.

- Phelps Dodge (1990's) - Soil sampling and drilling. Drilling completed at Nyungu (Drillholes NYU1 and NYU2).
- ZamAnglo (2000 - 2003) – Regional and infill soil sampling. Geological mapping, IP/CR/CSAMT geophysical surveys. Three phases of RC drilling, two programmes at Mumbhezhi (MBD00RC001-011 and MBD01RC001-009) and one regional programme (MBD02RC001- 007; 012).
- Equinox (2003 – 2008) – unknown but some drill collars located are presumably from this phase of work.
- Orpheus Uranium Limited (previously Argonaut Resources NL (2011-2021), various phases of intermittent drilling in JV with Antofagasta of Nyungu, Kabikupa and Lumwana West (LMW) prospects.
- Further drilling and exploration works (including geophysics and geochemical surface sampling) were conducted between 2012-2021 on the Nyungu (Central, South, East and North), West Mwombhezhi, Kabikupa, Kamafamba, Mufuke, Sharamba and Luamvunda prospects by Orpheus Uranium Limited both internally and under a JV with Antofagasta plc. As part of this UTS flew a high resolution aeromagnetic and radiometric survey in 2012, which was audited by Earth Maps. This was accompanied by a detailed Landsat structural interpretation and in addition induced polarization programmes were initiated with mixed results at Nyungu Central and North.

Geology

- Deposit type, geological setting, and style of mineralisation.
- The style of copper and cobalt mineralisation being targeted is Lumwana Mine style, structurally controlled, shear hosted, Cu +/- Co (+/- U and Au), which are developed within interleaved deformed Lower Roan and basements schists and gneisses. The predominant structural trend is north-south. Southeast – northwest and to a lesser extent southwest-northeast cross-cutting structures have also affected the ore body.

Drill hole Information

- A summary of all information material to the understanding of
- Drilling is not being reported in this ASX release.

	the exploration results including a tabulation of the following information for all Material drill holes: ○ easting and northing of the drill hole collar ○ elevation or RL (Reduced Level – elevation above sea level in meters) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	• No data aggregation was used for the geochemical sampling.
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear	• Drilling is not being reported in this ASX release.

	statement to this effect (eg 'down hole length, true width not known').	
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Location maps are attached in the body of the release.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Termite hill geochemistry values are of a higher tenor, but largely coincident with elevated historical Argonaut soil values. This is thought largely to be a function of the termite hill samples providing a better defined geochemical anomaly over deeper buried deposits.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	- For Nyungu South, a coincident IP chargeability anomaly is apparent with the interpreted copper mineralisation and hence considered a useful exploration targeting method. - Coincident Cu surface geochemical anomaly to greater than 200ppm Cu. - No bulk density information is available. - Limited metallurgical test work programmes have been conducted on fresh sulphidic mineralisation from Nyungu, with encouraging preliminary results producing a copper concentrate at 25.6% Cu and showing 87% recovery.
Further work	- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	- The Company proposes to undertake Scoping Studies and Feasibility Studies and seek to bring the Mumbezhi Project into commercial copper production as soon as is practicable, if economic to do so. - Prospect will also review all other copper anomalies defined on the Mumbezhi licences as potential satellite open pit feed options to a central mining and processing facility hub, situated proximal to the prospective Nyungu series of deposits, which are presently considered the flagship assets at the Project. - Induced Polarisation (IP) surveys were completed by Prospect over five prospective areas outside of Nyungu Central in 2024, which had been subjected to limited historical exploration by Argonaut Resources NL.

- This geophysical survey work covered identified Cu mineralisation at Kabikupa, Nyungu North, Sharamba, Mwombezhi West and a coherent Cu in soil geochemical anomaly at Nyungu East.
- Phases of further exploratory and development drilling are planned for Nyungu Central and Kabikupa, where copper Mineral Resource estimates have recently been reported by Prospect.
- Scout exploratory drill testing of multiple regional drilling targets defined by IP chargeable anomalies and supporting surface Cu geochemical anomalies will also be tested during the Zambia dry season in 2025.
