

8,000m+ AC Drill Program at Tin Can

HIGHLIGHTS

- Follow up soil sampling at Tin Can extends gold and arsenic anomalies
- Geophysical Survey returns subtle anomalies associated with the Tin Can mineralised trend
- 8,000m+ Aircore drill program to commence, testing combined geochemical and geophysical targets
- Drilling to include follow up of the newly discovered Tin Can West prospect, which returned 4 metres @ 9.0 g/t Au from 12 to 16 metres¹

Peregrine Gold Limited (“Peregrine” or the “Company”) (ASX: PGD) is pleased to announce the results of an extended soil sampling program and geophysical survey along the Tin Can Trend, located within the Company’s 100% owned Newman Gold Project (Figure 1).

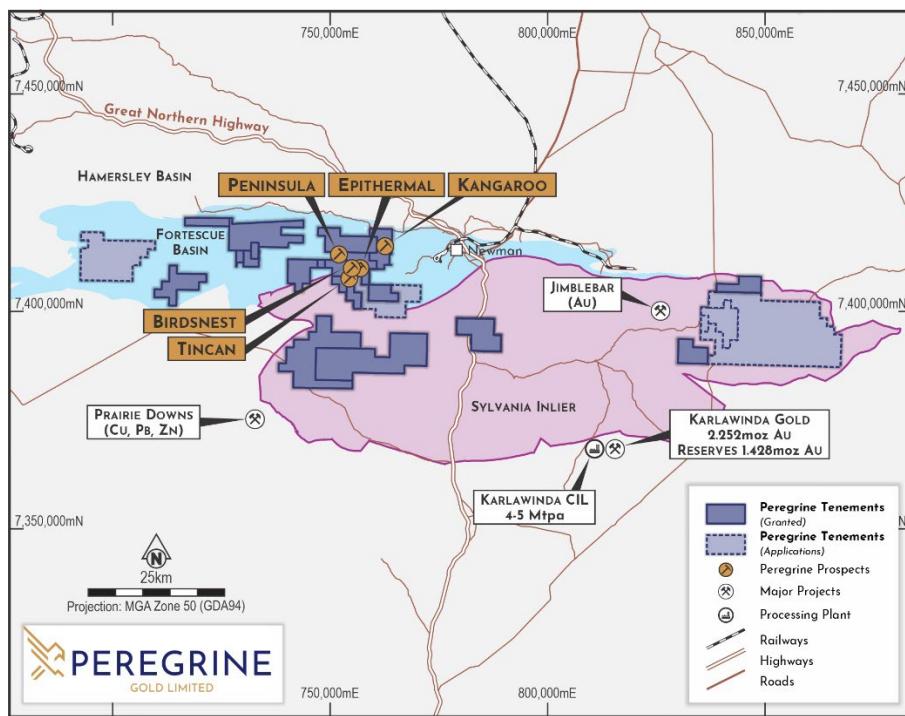

Figure 1: Location of the Tin Can Prospect (within tenement E52/3785) within the Newman Gold Project.

Accompanying these results, the Company advises an 8,000m+ Aircore drill program will commence on receipt of all necessary approvals to investigate the entire extent of the expanded anomalous gold and arsenic footprint (Figure 2).

¹ Refer ASX Announcement New High-Grade Zone – Tin Can West released 25 September 2024.

Follow Up Soil Sampling

Additional soil sampling was conducted further east and west of Tin Can in late 2024. The soil sampling (Table 1) returned several gold anomalies and the continuation of a broad arsenic halo. These results are encouraging as they extend the footprint of the overall Tin Can anomaly further west of the previously announced Tin Can West discovery which returned 4m at 9.0g/t Au from 12 to 16m¹.

The arsenic halo remains open to the west and extensions of the trend will be tested with further soil sampling to occur in late April.

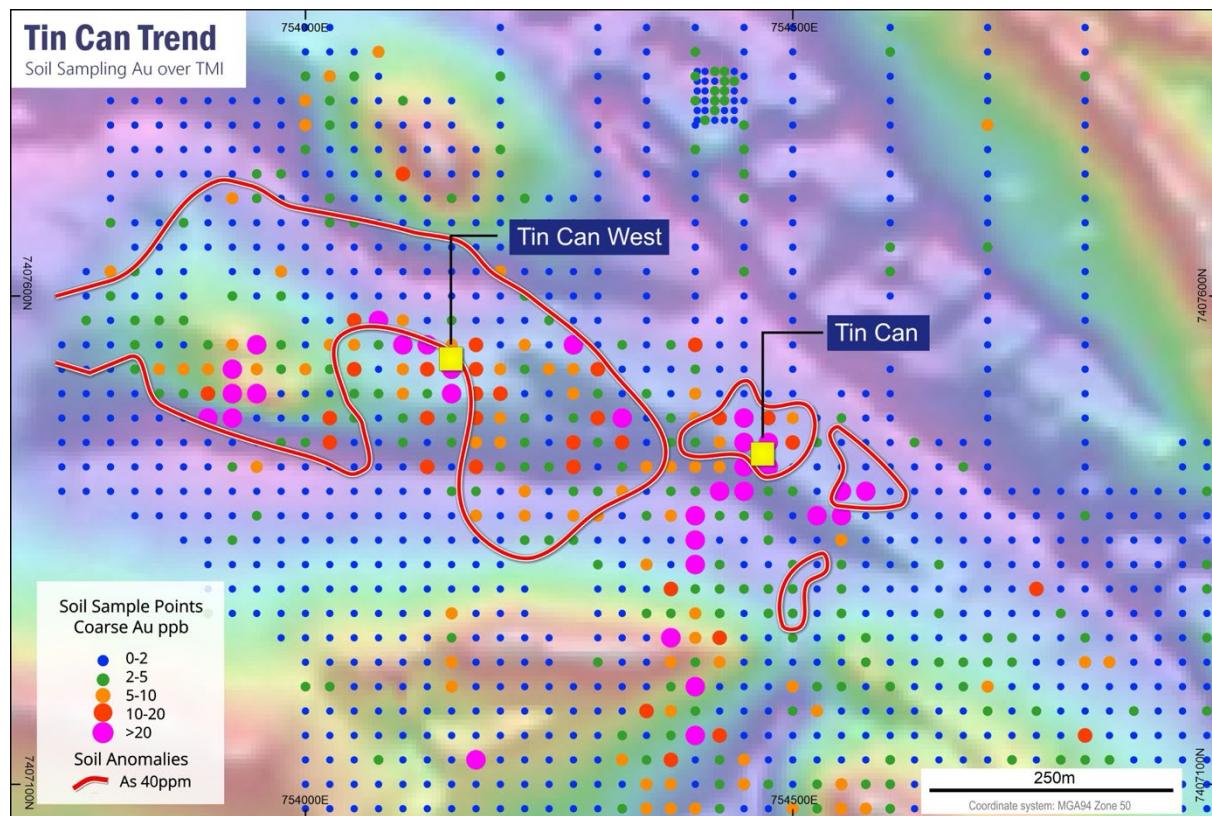

Figure 2: New Gold (Au) & Arsenic (As) soil sample results at the Tin Can & Tin Can West Prospects (E52/3785).

Geophysical Survey Results

As announced to the market on 22 October 2024, the Company committed to several geophysical surveys at the Tin Can and Tin Can West prospects, including Gradient Array Induced Polarisation (GAIP) and Dipole-Dipole Induced Polarisation (DDIP) which, following execution, covered an ~1.6km long (NW-SE) by ~1.3km wide (NE-SW) grid area.

The IP surveys have produced some interesting results that have assisted interpretation and targeting, and prioritisation of drill targets along strike of the Tin Can and Tin Can West prospects (Figure 3). The known higher-grade gold mineralisation intersected at the Tin Can prospects to date does not have a significant IP anomaly response, either in the IP chargeability or resistivity data, but there are other weakly elevated IP chargeability anomaly responses along strike to the northwest and within the broad Gold (Au) + Arsenic (As) soil geochemical anomaly zone that have potential to represent sulphide mineralisation that may be associated with gold mineralisation.

¹ Refer ASX Announcement New High-Grade Zone – Tin Can West released 25 September 2024.

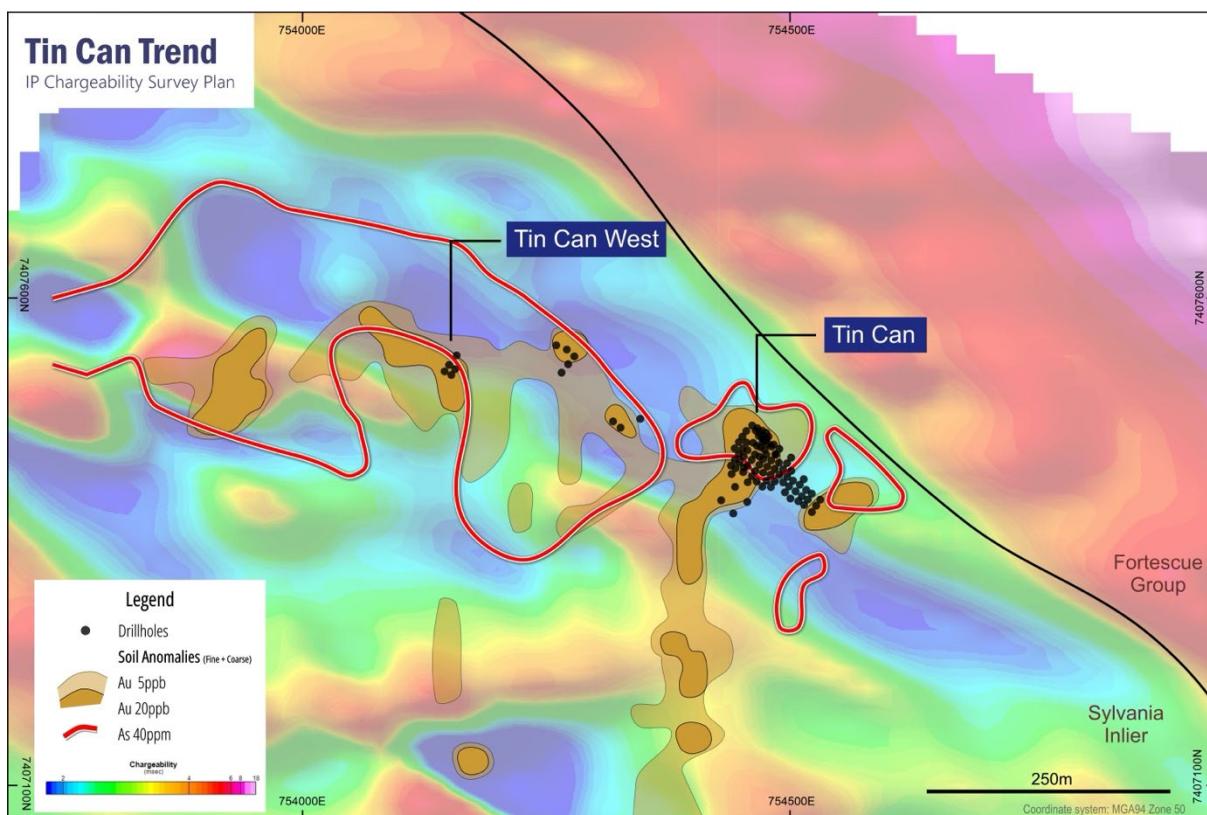

Figure 3: GAIP Survey results displaying subtle chargeability anomalies coincident with Gold (Au) & Arsenic (As) soil anomalies

IP anomaly trends having elevated chargeability and lower resistivity (higher conductivity) within the eastern part of the GAIP survey area are interpreted to represent graphitic sediments of the Jeerinah Formation which are mapped along strike to the southeast in GSWA 1:100,000 scale mapping. However, there is limited drilling data in the local prospect area to confirm this interpretation and further exploration work including field mapping and drill testing of this trend will occur in the future.

8,000m+ Aircore Drilling Program to Commence

Following the results of these geochemical and geophysical programs, the Company has finalised an 8,100m Aircore Drill program aimed at investigating the entire strike extent of the gold and arsenic anomaly (Figure 4).

A heritage survey was conducted in March and preliminary approval has been received with the approved POW expected by the end of April. A drilling contractor has been selected.

The planned Aircore program comprises 81 holes and an average depth of 100m per hole. The Company anticipates commencing in May and reporting to the market with final results in August.

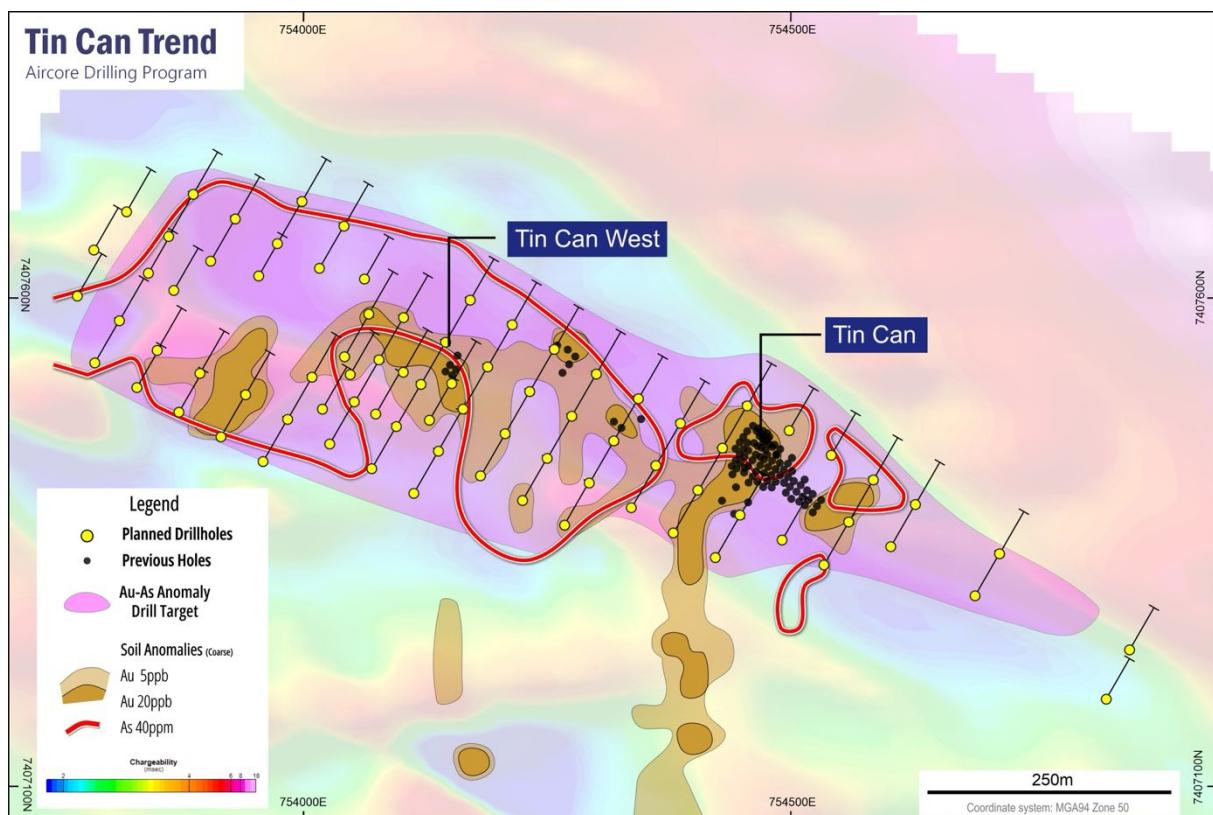

Figure 4: Tin Can and Tin Can West drill plan relative to the newly inferred Gold (Au) & Arsenic (As) anomaly.

Technical Director of Peregrine Mr. George Merhi commented:

"With the entire anomalous footprint to be investigated and having already identified significant gold intercepts along trend, we are excited about the future work programs and potential additional discoveries at the Tin Can and Tin Can West prospects. We look forward to reporting to the market the results of this drill program as soon as practically possible."

This ASX Announcement has been approved in accordance with the Company's published continuous disclosure policy and authorised for release by the Company Board of Directors

COMPETENT PERSONS STATEMENT

The Information in this Report that relates to previously released Exploration Results for the Newman Project is extracted from Peregrine Gold Limited's ASX announcements titled "New High-Grade Zone - Tin Can West" released on 25 September 2024 and "Fourth Gold Prospect Identified at the Pilbara Gold Project" released 16 November 2021, which is available on <https://www.peregrinegold.com.au/investors/asx-announcements/>.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates or production targets or forecast financial information derived from a production target (as applicable) in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's (Technical Director – George Merhi) findings are presented have not been materially modified from the original market announcements.

FORWARD LOOKING STATEMENTS

Statements regarding plans with respect to Peregrine's projects are forward-looking statements. There can be no assurance that the Company's plans for development of its projects will proceed as currently expected. These forward-looking statements are based on the Company's expectations and beliefs concerning future events. Forward looking statements are necessarily subject to risks, uncertainties and other factors, many of which are outside the control of the Company, which could cause actual results to differ materially from such statements. The Company makes no undertaking to subsequently update or revise the forward-looking statements made in this announcement, to reflect the circumstances or events after the date of that announcement.

Note: 'X' denotes below detection limit

Table 2 - Appendix 1: JORC Code, 2012 Edition

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<p><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></p> <p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p> <p><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></p> <p><i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></p>	<p>Soil & Stream Sampling</p> <p>The soil and stream sediment sampling protocol included a fine fraction (-2mm) and coarse fraction (-5mm+2mm) sample, weighing approximately two-three kilograms and one-two kilograms respectively collected and sieved on site.</p> <p>Peregrine fine fraction samples were analysed for gold by a two kilogram cyanide leach. Coarse and fractions analysed for gold as well as a suite of 53 multi-elements by aqua regia.</p> <p>Geophysical Surveys</p> <p>Gradient array IP (GAIP): 1 survey grid area; and</p> <p>Dipole-dipole IP (DDIP): 3 traverses</p> <p>IP Survey Contractor: Khumsup Geophysics Equipment:</p> <p>Transmitter: GDD Tx-II</p> <p>Receiver: GDD Rx-16</p> <p>GAIP transmitter electrodes: aluminium foil in small shallow pits</p> <p>GAIP and DDIP receiver electrodes: copper sulphate porous pots</p> <p>Transmitter frequency: 0.125 Hz (2 second time base)</p> <p>Typical GAIP transmitter current: 7.4 - 8.9 A</p> <p>Typical DDIP transmitter current: 5.4 - 7.9 A</p> <p>GAIP transmitter electrode dipole spacing: 3.2 km</p> <p>GAIP receiver electrode dipole spacing: 50 m</p> <p>DDIP transmitter electrode dipole spacing: 200 m</p> <p>DDIP receiver electrode dipole spacing: 50 m.</p>
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Not applicable – no drilling undertaken.
Drill sample recovery	<p>Method of recording and assessing core and chip sample recoveries and results assessed.</p> <p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	Not applicable – no drilling undertaken.

Criteria	JORC Code explanation	Commentary
Logging	<p><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <p><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></p> <p><i>The total length and percentage of the relevant intersections logged.</i></p>	No logging was undertaken.
Sub-sampling techniques and sample preparation	<p><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></p> <p><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></p> <p><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></p> <p><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></p> <p><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></p> <p><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></p>	Samples were screened in the field as described in "Sampling techniques" above. Random field duplicates and blanks were inserted..
Quality of assay data and laboratory tests	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></p>	Peregrine samples utilised the aqua regia and BLEG methods ICP-MS is an appropriate technique for early stage exploration.
Verification of sampling and assaying	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p> <p><i>The use of twinned holes.</i></p> <p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p> <p><i>Discuss any adjustment to assay data.</i></p>	Due to the early stage of exploration and type of work completed to date, no verification nor check assaying has been undertaken to date.
Location of data points	<p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p> <p><i>Specification of the grid system used.</i></p> <p><i>Quality and adequacy of topographic control.</i></p>	Handheld GPS unit – MGA94 zone 50 (GDA).

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	<p><i>Data spacing for reporting of Exploration Results.</i></p> <p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p> <p><i>Whether sample compositing has been applied.</i></p>	<p>Soil & Stream Sampling</p> <p>Soil sampling has initially been completed on 25m x 25m spacing.</p> <p>Geophysical Surveys</p> <p>GAIP receiver station spacing: 50 m</p> <p>GAIP receiver line spacing: 100 m with infill to 50 m over central area</p> <p>DDIP receiver station spacing: 50 m</p> <p>DDIP transmitter station spacing: 50 m</p> <p>DDIP survey line spacing: variable.</p>
Orientation of data in relation to geological structure	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p> <p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<p>North-South sample lines are slightly oblique to the regional geological trend. At this early stage of exploration this orientation is considered appropriate.</p> <p>Geophysical Surveys</p> <p>GAIP and DDIP: NE-SW oriented transmitter electrode dipoles and receiver survey line traverses perpendicular to local geological strike.</p>
Sample security	<i>The measures taken to ensure sample security.</i>	<p>Samples were road freighted back to Perth and delivered to the assay laboratory in Perth.</p> <p>Sample security levels are considered appropriate for a preliminary reconnaissance assessment.</p>
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	The Company carries out internal audits/reviews of procedures, however no external reviews have been undertaken.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p> <p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>The exploration results in this report relate to Exploration Licenses E52/3785. Tenure in the form of Exploration Licenses with standard expiry conditions and options for renewal.</p> <p>E52/3785 is 100% owned by Peregrine's subsidiary, Pilbara Gold Exploration Pty Ltd.</p> <p>The tenement is within the Nyiyaparli and Nyiyaparli #3 determination and claim for native title purposes.</p> <p>The tenements are in good standing and there are no known impediments.</p>
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<p>Limited regional exploration on E52/3785 was undertaken by previous companies and included geophysical, and geochemical surveys.</p> <p>Geochemical surveys included soil and stream sampling.</p>
Geology	<i>Deposit type, geological setting and style of mineralisation.</i>	<p>The tenement partially overlap the southeast corner of the Pilbara Craton with Archaean granite and minor greenstone exposed in the Sylvania Inlier. The northern margin of this terrane is in tectonic contact with the Fortescue and Hamersley Groups that lie within the Hamersley Basin. In the south it is unconformably</p>

Criteria	JORC Code explanation	Commentary
		<p>overlain by the Bresnahan and Bangemall basins that form the Bangemall Group. Gold deposits of significant scale occur in a variety of spatial and temporal settings.</p> <p>The assembly of the Archaean to Proterozoic rock between the Pilbara and Yilgarn cratons is referred to as the Capricorn Orogen. Approximately 1000km long and 500km wide, the damage zone of this orogen records this punctuated Proterozoic construction. It includes the deformed margins of these cratons as well as the continental margin rocks such as the Hamersley Basin, meta-igneous and metasedimentary rocks of the Gascoyne Complex and numerous low-grade sedimentary rocks such as the Bresnahan Basin.</p> <p>Throughout the region there are numerous gold, base metal and rare earth element occurrences. Deposits of significance are observed within the boundaries of the Capricorn Orogen which include the nearby Bibra, Paulsons/Whyloo Dome, Plutonic, Ashburton Project and the DeGrussa copper-gold-silver deposit.</p>
Drill hole Information	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> ○ <i>easting and northing of the drill hole collar</i> ○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> ○ <i>dip and azimuth of the hole</i> ○ <i>down hole length and interception depth</i> ○ <i>hole length.</i> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p>	Refer to tables included in the body of the report.
Data aggregation methods	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	Only field observations have been reported. There has been no data aggregation.
Relationship between mineralisation widths and intercept lengths	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></p>	Due to the poor outcrop coverage in the prospect area, width of mineralisation is currently unknown.

Criteria	JORC Code explanation	Commentary
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Refer to diagrams in body of the report.
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	All available relevant information is presented.
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	All available relevant information is presented.
Further work	<p><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	Future exploration activities may include additional Air-Core drilling and costeaning. Subject to these results, follow up RC/DD may be planned.
