ASX ANNOUNCEMENT

28 April 2025

ASX: INF I FRA: 3PM

OPTION AGREEMENTS ON GOLD-COPPER-SILVER PROJECTS

KEY POINTS

- **Option agreements for Acquisition (Mitta Mitta) and Earn-In Joint Venture (Corryong) over Gold-copper-silver exploration projects on granted tenements in the Lachlan Fold Belt, Victoria.**
- **Projects complement and adjoin existing portfolio assets and consolidate a significant historic gold field with significant high-grade drilling results to be followed up.**

<u>Mitta Mitta (Option to acquire 100%)</u>

- **Six granted, contiguous tenements which adjoin existing Infinity tenure and consolidate prospective geological host rocks and historic gold fields (Granite Flat and Sandy Creek goldfields that have produce in excess of 160,000 oz gold).**
- **Granite Flat provides a bulk tonnage gold-copper target with later, cross-cutting high-grade gold veins.**
- **Significant intercepts include:**
    - **19m @ 9.39 g/t gold incl. 3m @ 41.1 g/t gold, 19m @ 0.61% copper and 19.2 g/t silver from 28m (EMPRAB28)**
    - **4m @ 3.23 g/t gold from 15m (EMPRAB29)**
    - **9m @ 2.1 g/t gold from 12m (EMPRAB32)**

- **Sandy Creek is a historic very high-grade gold field which has had only one campaign of drilling/sampling programme conducted to date (RAB drilling). Significant intercepts include:**
    - **5m @ 5.75 g/t gold from 18m incl. 3m @ 8.8 g/t gold from 18m (SRERAB32B)**
    - **5m @ 3.96 g/t gold from 2m (SRERAB37)**
    - **9m @ 1.75 g/t gold from 31m (SRERAB06)**

- **Acquisition required modest upfront consideration with payment weighted to shared success of exploration.**

Corryong (Option to earn 80%)

- **Mt Unicorn drilling shows extensive Cu-Ag-Mo porphyry mineralisation to depths over 700m below surface.**
- **Mt Unicorn shows the potential for additional porphyry style mineralisation within the Project.**
- **Several prospective targets defined by geochemical sampling and coincident geophysics to be investigated.**

Corporate

- **Exceptional exploration opportunities expand existing tenure and commodity focus.**
- **Low up front consideration with later payments linked to shared exploration success.**
- **Immediate exploration now activity possible whilst San Jose Lithium Project Mining Licence Application is being assessed.**

Infinity Lithium Corporation Limited ('**Infinity**', or '**the Company**') is pleased to announce that it has entered into option agreements in respect to the acquisition of a 100% interest in the Mitta Mitta Project ('**Mitta Mitta'**) tenements held by Dart Mining N.L ('**Dart**' or '**Dart Mining**') and an option to enter into an earn-in Joint Venture on the Corryong Project ('**Corryong**') tenements also held by Dart in the Lachlan Fold Belt, eastern Victoria (Figure 1). Dart is focussed on antimony and gold exploration in Queensland, enabling Infinity to enter into these agreements to potentially acquire/JV these prospective projects (see Schedule 1) for minimal upfront consideration.

Infinity Executive Chairman Mr Adrian Byass said "*These agreements give Infinity the opportunity to carefully assess and if we decide, acquire a potentially significant gold project which immediately adjoins existing recently acquired tenure, thus allowing consolidation of a major goldfield and highly prospective geological unit (The Banimboola Quartz-Monzodiorite) that is associated with gold-copper mineralisation at Granite Flat (Mitta Mitta Project) and extends into EL7072 which is 100% owned by Infinity. That some project tenements under option immediately adjoin recently acquired existing tenure provides outstanding synergies.*

We also have the ability to enter into an earn-in Joint Venture over the Corryong project which hosts significant porphyry-style gold-copper-molybdenum mineralisation (Mt Unicorn) which is proof of the potential for the rocks in the Project to host significant copper +/- silver, molybdenum, gold porphyry mineralisation and support the exploration model. Should we enter into the Joint Venture that we have the option over, there are compelling coincident geophysics and soil sampling targets to drill test.

The opportunity to potentially expand our existing gold-copper-silver portfolio with opportunities such as walk-up drill targets extending high-grade results in the Lachlan Fold Belt and combine our immediate exploration focus is highly attractive. "

The Option and Purchase Agreement and Option and Earn-in Joint Venture Agreement ('**Agreements'**) are binding agreements which give Infinity a 60 day exclusivity period in which the Company can, at its sole election,

- elect to enter into a 100% Purchase Agreement in respect to the Mitta Mitta Project on the terms and conditions as contained in Schedule 2 and jointly or separately, at its sole election;
- enter into a Joint Venture earning up to 80% interest in the Corryong Project (Figure 1) on the terms and conditions as contained in Schedule 4.

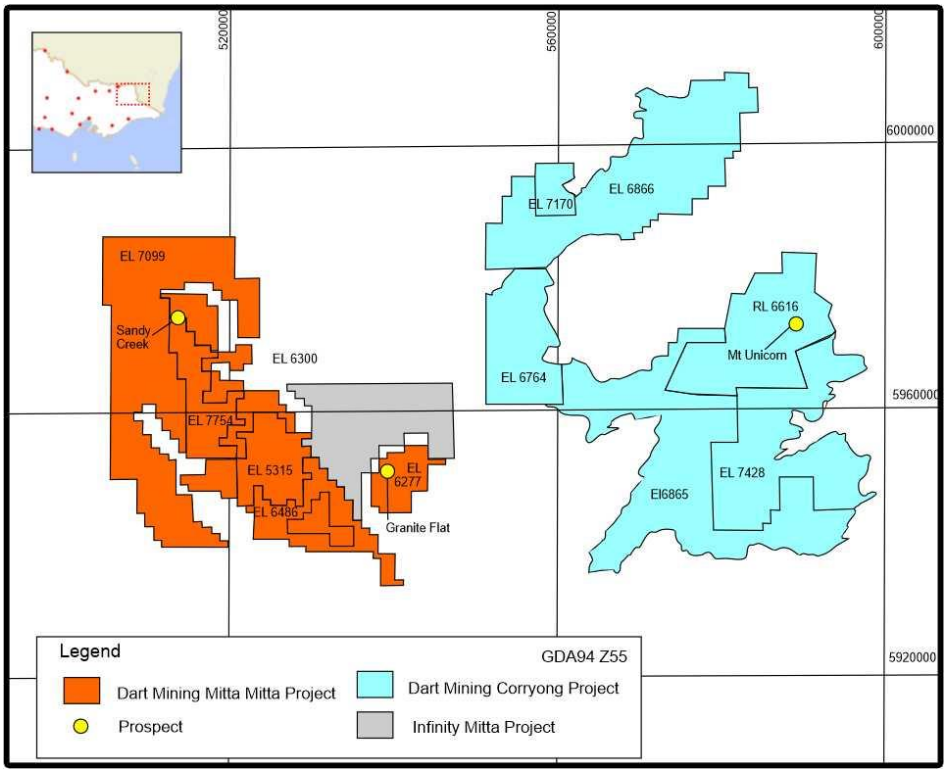

Figure 1: Tenements held by Infinity (Blue) and Tenements under Option Agreements with Dart Mining (orange)

1 Mitta Mitta Project

The Mitta Mitta Project is located in northeastern Victoria and adjoins Infinity's 100% owned Mitta Project (EL7072) (see Infinity ASX announcement 31 March 2025) as shown in Figure 2. The Mitta Mitta Project contains the advanced and highly prospective Granite Flat gold-copper-silver and the Sandy Creek gold Prospects.

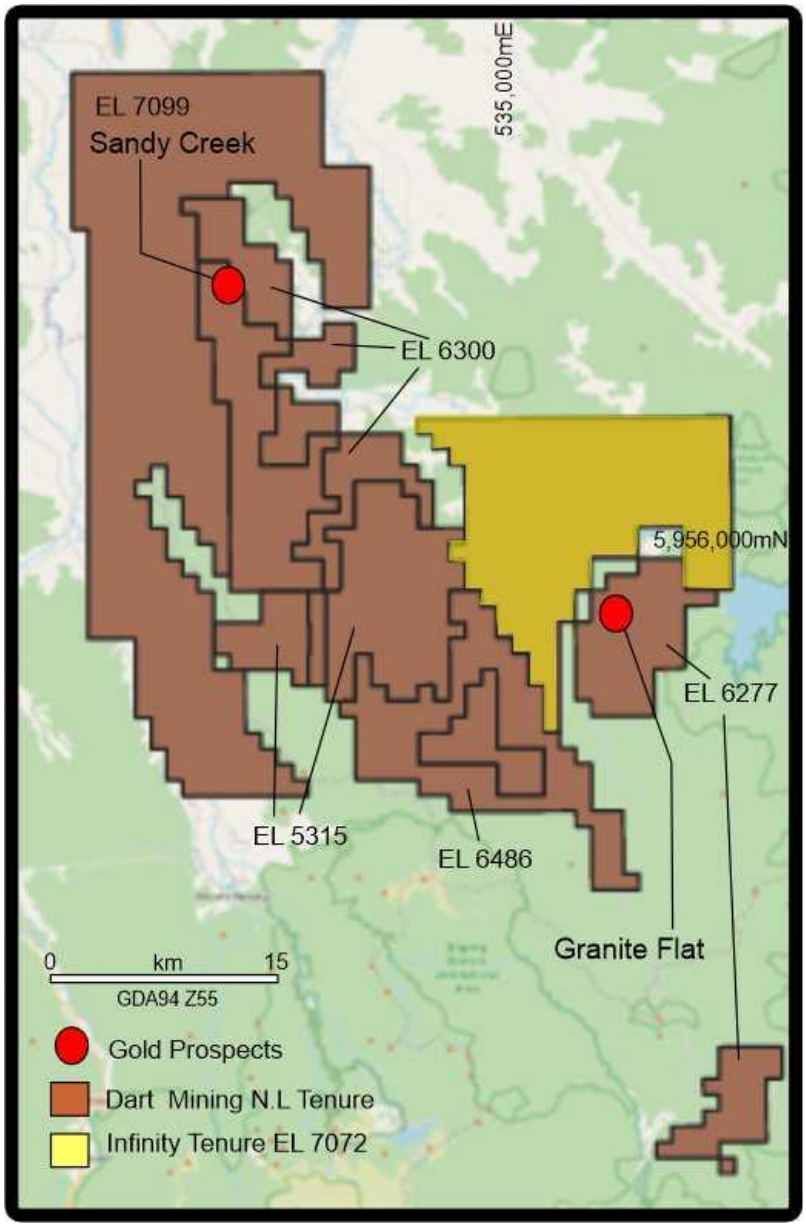

Figure 2: Mitta Mitta project with location of Granite Flat and Sandy Creek Prospects. Infinity (100%) tenure (EL 7072) shown, Tenure under Option Agreements with Dart Mining (brown).

1.1 Granite Flat

The Granite Flat Prospect is hosted within the Banimboola Quart-Monzodiorite that extends into Infinity's 100% owned adjoining tenement EL7072 (Mitta Project). Drilling to date by Dart at Granite Flat has focussed on readily accessible drill locations which require minimal permitting (Low Impact Exploration). These have targeted the two styles of mineralisation at Granite Flat (broad, bulk tonnage gold-copper target and later-stage, cross-cutting, high-grade gold +/- copper-silver structurally controlled veins). Drilling to date has returned the following significant results which include;

- 19m @ 9.39 g/t gold inc 3m @ 41.1 g/t gold, 19m @ 0.61% copper and 19.2 g/t silver from 28m (EMPRAB28)
- 4m @ 3.23 g/t gold from 15m (EMPRAB29)
- 9m @ 2.1 g/t gold from 12m (EMPRAB32)

in vein hosted settings and;

- 19.33m @ 0.72 g/t Au & 0.1% Zn from 72.07-91.40m, including 4.42m @ 1.2 g/t Au & 1m @ 0.74% Zn, and 12.93m @ 0.29% Cu $ 13.2 g/t Ag from 72.07-85.0m EMDDH003
- 17.2m @ 1.2 g/t Au @ 2.9 g/t Ag from 46-63.3m, including 2.3m @ 5.6 g/t Au & 6.3m @ 5.6 g/t Ag, and 18.3m @ 0.24% Cu from 45-63m EMDDH004 (designed as a twin for EMPRAB28 drilled in 2021).

(Dart Mining ASX release dated 15th February 2022)

Infinity believes that Empress/Granite Flat represents a large Cu-Au in soil anomaly, both aerially (1.8x2.4km >100ppm Cu) and in tenor (Au up to 3g/t Au) (Figure 3) which has not been tested adequately due to a lack of infrastructure/access to test the best targets.

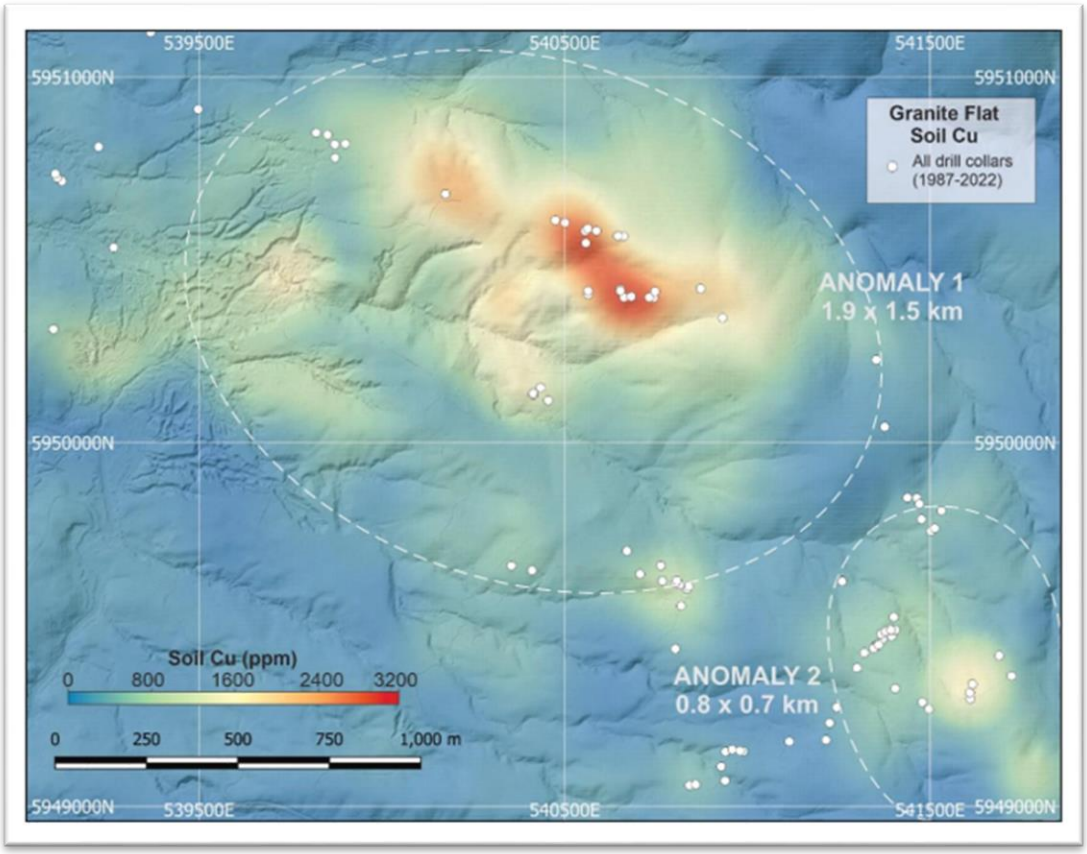

Figure 3: Granite Flat copper anomaly heat map showing drill collars completed to date (2022).

1.2 Sandy Creek

The Sandy Creek Goldfield is located 60 km south of Albury-Wodonga in Northeast Victoria along the northern section of the Dorchap Range near Eskdale. The Dorchap range also hosts Dart Mining's Lithium projects.

The Sandy Creek Goldfield is known for its historical production of exceptionally high-grade gold from narrow lodes (up to 3.5 kg/t ~112 oz/t Wodonga & Towong Sentinel, 1888) (Dart Mining ASX release dated 20th March 2024). Multiple zones of gold mineralisation are associated with altered granite at structural intersections within the Yabba Granite.

Gold mineralisation is associated with hydrothermal alteration of the Yabba Granite and extends into a metasedimentary roof pendant above the granite body. Detailed structural mapping has identified

an orthogonal fault system that has focused gold mineralisation on north-south and northwest-southeast oriented structures.

This is an exceptionally high-grade goldfield associated with multiple structures intersecting granitic intrusions. Records referenced by Dart Mining in ASX release dated 20 March 2024 indicate that 160,000 oz of gold was produced from 11,000 tonnes of ore between 1877 – 1915 from Sandy Creek reefs (Lanzer L.A, 1988). Included amongst this are reported head grades of 3562 g/t from the A1 Lloyds mine, although compiled contemporary newspaper reports indicate the average grade across the field was 77 g/t. Structures show potential for larger tonnage targets with disseminated gold in sulphides reported surrounding high-grade shoots.

Only one campaign of drilling has been completed and assayed at Sandy Creek. This utilised Rotary Air Blast (RAB) drilling and was conducted by Dart Mining (ASX release Dart Mining 16th February 2021). Whilst the drilling method (RAB) was suitable for the first-pass reconnaissance programme undertaken it was not able to penetrate fresh rock, nor penetrate past mining voids when it intersected several areas of historical workings and was not able to drill effectively below the water table. Dart Mining noted that follow-up drilling would have to be conducted using Reverse Circulation (RC) or Diamond drilling to accurately test mineralisation encountered and targets unable to be tested at the time (Dart Mining ASX release dated 7th December 2020).
Despite this, significant intercepts from the limited (1,308m from 43 holes RAB drilling campaign, Figure 4) included:

- 5m @ 5.75 g/t gold from 18m incl 3m @ 8.8 g/t gold from 18m (SRERAB32B)
- 5m @ 3.96 g/t gold from 2m (SRERAB37)
- 9m @ 1.75 g/t gold from 31m (SRERAB06)

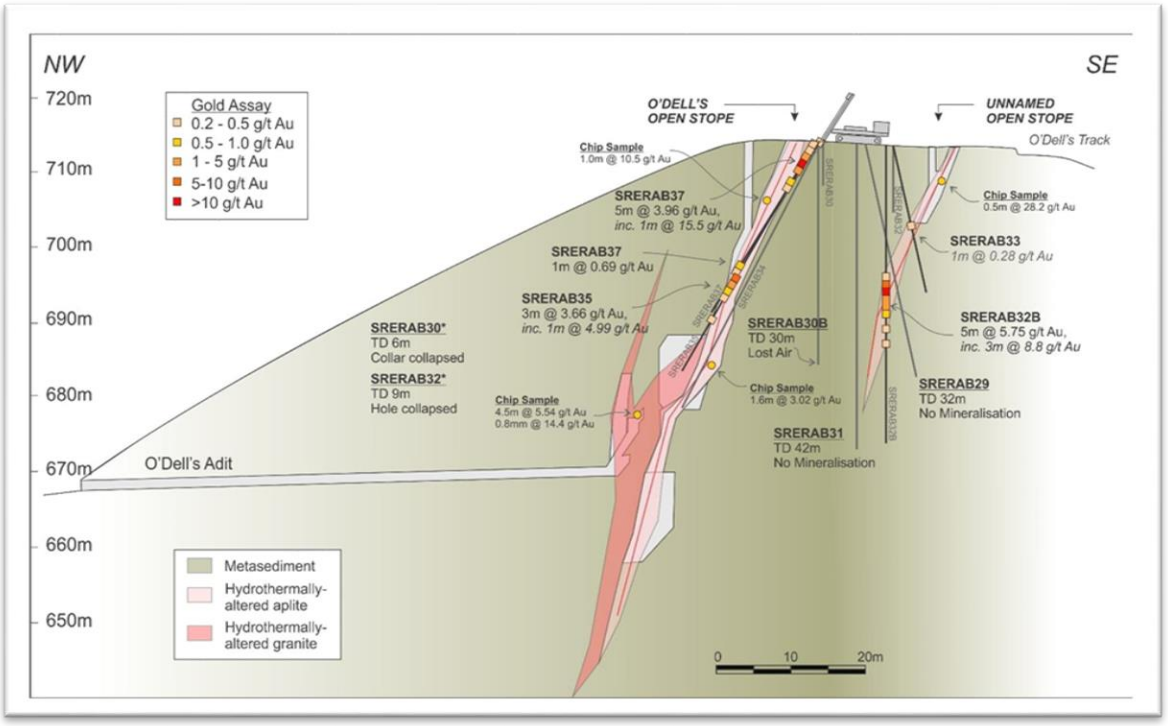

Figure 4: : Cross Section of drilling at Sandy Creek (O'Dells shaft) taken from Dart Mining ASX release 16th February 2021.

This drilling was designed to test the potential of a 'roof-pendant' model within granite and results were highly encouraging. The limited number of effective drill holes still returned several significant, high-grade results, even though the campaign was not effective as it was "*hampered by the prevalence of un-mapped historical workings, a very high water table and steep, slippery terrain. Some holes did not reach the planned depth but did appear to be entering mineralisation zones upon termination. Future drilling at Sandy Creek will employ a drill rig that is capable of returning sample from below the water table and reaching greater depths than the exploratory RAB rig used on the first phase programme*." (Dart Mining ASX release dated 7th December 2020).

There has been no follow up drilling at Sandy Creek after this campaign. Infinity believes this is a highly prospective target which requires immediate exploration attention as it has the potential based on results to date for significant high-grade gold mineralisation.

Lithium potential

The Mitta Mitta project tenure contains the Dorchap lithium project. Dart entered into an earn-in Joint Venture with Sociedad Quimica y Minera de Chile S.A (SQM), a major international lithium company for lithium minerals within the tenement package. SQM are earning up to 70% through the expenditure of $12 million over 6 years of which $3 million was to be spent before July 2025 (Dart Mining N.L ASX release 26 July 2922). At the time of this Agreement, SQM have conducted exploration activity but there has been no announcement as to the status of the earn-in and whether milestones thresholds have been met or the status of the JV (Dart Mining N.L ASX release 16th December 2022 and 30th May 2023). It is noted that SQM are still in their first earn-in period.

2 Corryong Project

Located in northeastern Victoria, approximately 20km south of the Corryong township, proximal to the Victoria – New South Wales border is the Mt Unicorn porphyry (Figure 5) located within a highly prospective region for porphyry targets. This project has been drill-tested (last drilling conducted in 2012) and contains significant copper-silver-molybdenum mineralisation (Dart Mining ASX release dated 18th December 2012). The surrounding area is prospective for repeat examples of porphyry style mineralisation with several prospects identified based on surface sampling, mapping and geophysics.

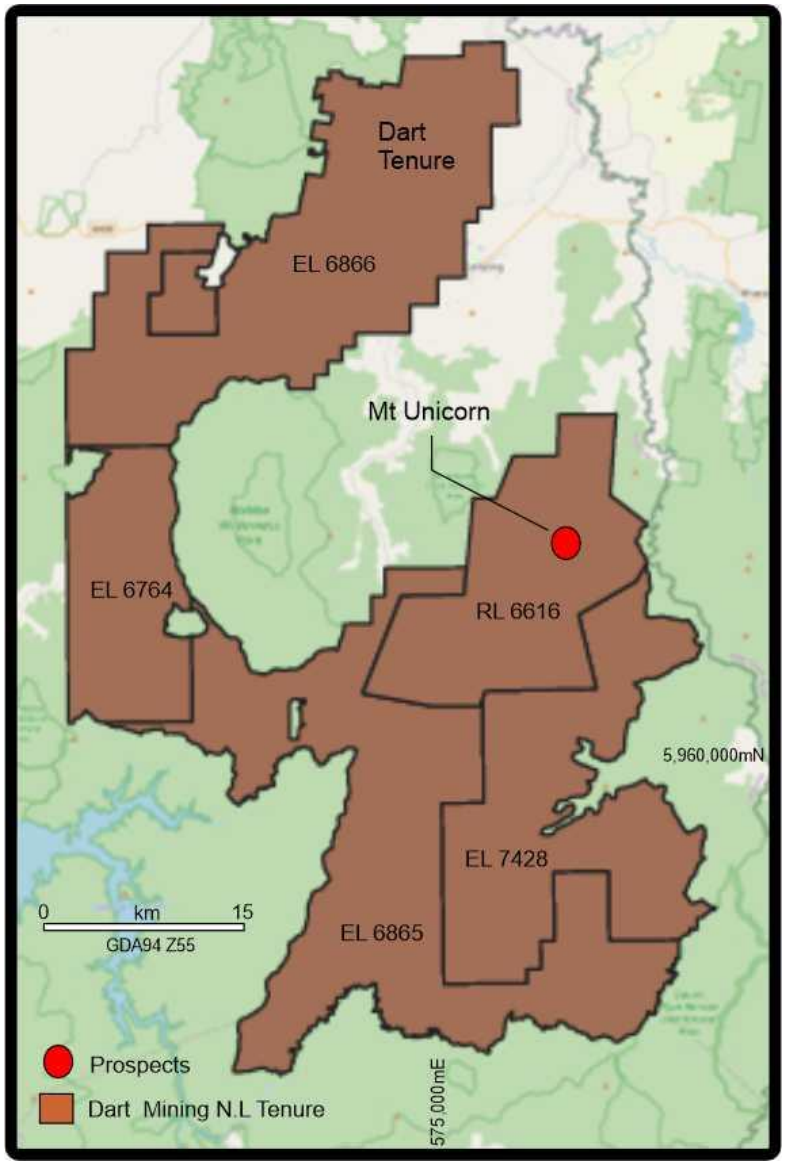

Figure 5: Corryong Project tenure under Option Agreement with Dart Mining shown in orange.

Dart Mining conducted exploration and delivered an economic assessment of Mt Unicorn (2012). The geological model held by Dart is that Mt Unicorn is analogous to the Henderson deposit in the U.S.A (Dart Mining ASX release 27th November 2012).

A schematic interpretation of Mt Unicorn is shown in Figure 6. This highlights the extensive depth of mineralisation confirmed by drilling and the zonation within the system that supports the Henderson comparison.

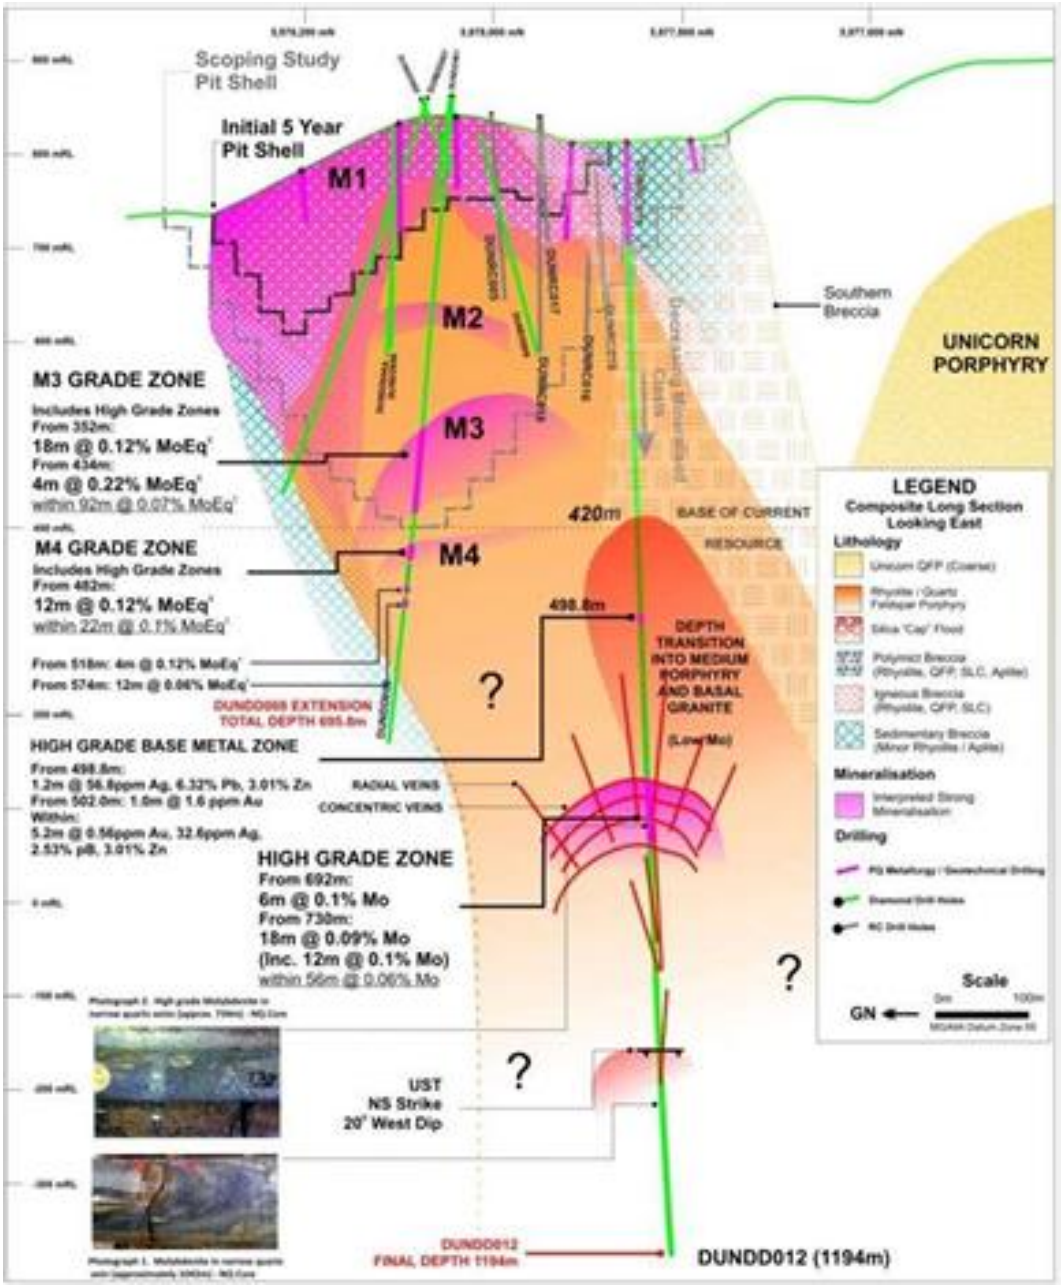

Figure 6: Schematic cross section showing geological model for porphyry system at Mt Unicorn. Taken from Dart Mining ASX release dated 18th December 2012.

Infinity is focussed on possible opportunities for other porphyry style mineralisation with several identified targets such as Gentle Annie and Stacey's within the tenure (Figure 7). These have potential for gold-copper-silver-molybdenum mineralisation in a porphyry setting (Dart Mining ASX release dated 21st February 2024).

Cautionary Statement: the Exploration Results in respect of the Corryong Project have not been reported in accordance with JORC 2012. A competent person has not done sufficient work to disclose the exploration results in accordance with JORC 2012. It is possible that following further exploration and evaluation that the confidence in the prior reported exploration results may be reduced when reported under JORC 2012, however, nothing has come to the attention of the Company that causes it to question the accuracy or reliability of the exploration results disclosed in this announcement

.

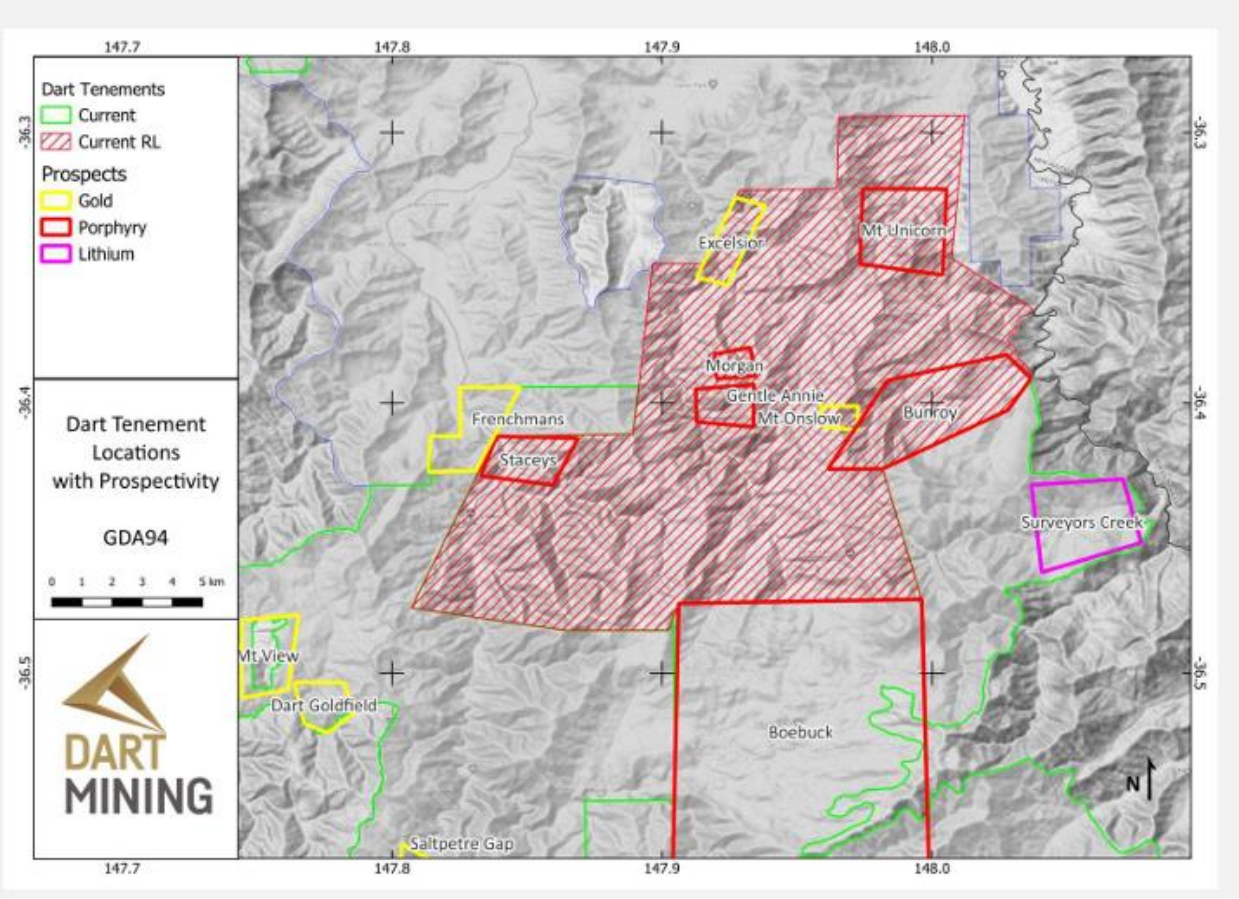

Figure 7: porphyry prospects and targets proximal to Mt Unicorn. Taken from Dart Mining ASX release 21st February 2024.

3 Agreements Summary

Infinity has entered into two binding option agreements with Dart;

1) Option and Purchase Agreement (Mitta Mitta Project)
2) Option and Earn-In Joint Venture Agreement (Corryong Project).

The agreements have been structured to incentive exploration success and reward for both parties (Schedule 2 and 4), with a $25,001 exclusivity cash payment and a modest upfront payment when exercising the options, predominantly comprising consideration of a $175,000 cash payment and 10,000,000 Ordinary Shares in Infinity ('**Consideration Shares**') therefore maximising the allocation of funds to exploration. The Consideration Shares will be issued within the Company's existing ASX Listing Rule 7.1 placement capacity.

35,000,000 Consideration performance rights, to be issued subject to shareholder approval at a meeting to be held as soon as practicable, will vest based on shared success resulting in increased exploration activity (drilling) and discovery (JORC mineral resource estimates).

If the Company opts to earn into the Joint Venture, the Company must contribute to the Joint Venture:

1) $1 million over three years to earn a 51% interest; and
2) a further $2.5 million over the next 2 years ($3.5 million total within 5 years from the date of the agreement) to earn a further 29% interest (total 80% interest).

Key Terms of the acquisition agreement are detailed in Schedule 2 and 4 with the impact on capital structures shown in Schedules 3 and 5.

The Company is well funded to pursue both the permitting process in Spain and to advance exploration in Victoria (INF December Quarterly Report 29 January 2025). The Company intends to provide further information including a more detailed exploration programme shortly.

As noted above, the Company continues to work with regulators in the permitting process for San Jose in Spain. As noted in prior ASX announcements, public consultation as initially proposed was delayed and additional requirements prior to public consultation have been requested.

Trading Halt

This is the announcement referred to in the Trading Halt Request dated 23 April 2025.

This Announcement was authorised by the board of Infinity. For further enquiries please contact:

Competent Persons Statement

The information in this report that relates to Exploration Results is based on the information compiled or reviewed by Mr Adrian Byass, B.Sc Hons (Geol), B.Econ, FSEG, MAIG and an employee of Infinity. Mr Byass has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of Exploration Results, Exploration Targets, Mineral Resources and Ore Reserves. Mr Byass consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.

In respect of the Corryong Project, Mr Adrian Byass has reviewed the information in the market announcement and confirms that it is an accurate representation of the available data and studies for the Corryong Project.

Schedule 1

Mitta Mitta Project Tenements (100% Dart Mining or wholly owned subsidiary)

Tenement Number	Holder	% Interest
EL 6277	Dart Mining NL	100
EL 6300	Dart Mining NL	100
EL 5315	Dart Mining NL	100
EL 6486	Dart Mining NL	100
EL 7099	Dart Mining NL	100
EL 7754	Dart Mining NL	100

Corryong Project Tenements (100% Dart Mining N.L or wholly owned subsidiary)

Tenement Number	Beneficial Holder	% Interest
RL 6616	Dart Mining NL	100
EL 6764#	Dart Mining NL	100
EL 6865	Dart Mining NL	100
EL 6866	Dart Mining NL	100
EL 7170	Dart Mining NL	100
EL 7428	Dart Mining NL	100

Held beneficially for Dart Mining by Mt Unicorn Holdings Pty Ltd

Tenure shown in Figure 8.

Schedule 2

Mitta Mitta Transaction terms and conditions

- Infinity will make an initial payment of $25,000 cash to secure exclusivity and be granted the option ('**Option**')
- To exercise the Option and acquire a 100% interest in the Mitta Mitta project, Infinity will be required to pay $175,000 cash and issue 10,000,000 ordinary shares to Dart.
- Subject to the exercise of the Option, Dart will receive a bonus payment of $200,000 in cash or shares at Infinity's election should Infinity sell all or part of the Mitta Mitta project for $1.2 million of more within 3 years of purchasing the Project.
- Subject to the exercise of the Option, Infinity will issue Performance Rights (Tranche A and B) for up to 35,000,000 shares are issued as outlined below;

Tranche	Consideration Performance Rights	Vesting Condition	Expiry Date
A	10,000,000	The Company announcing to ASX that it has completed at least 5,000 metres of drilling (excluding auger drilling) on the Project.	3 years from the date of issue
B	25,000,000	The Company announcing to ASX the definition of a JORC Code compliant Mineral Resource Estimate on a Tenement within the Project of 250,000 oz gold > 1.0 g/t or gold equivalent Au, Cu, Ag.	4 years from the date of issue

The issue of Performance Rights are subject to regulatory and shareholder approvals. At the time of exercising the Option, Infinity will determine whether the Performance Rights will be issued utilising available placement capacity under Listing Rule 7.1 or will be subject to shareholder approvals.

Schedule 3

Capital Structure post Mitta Mitta acquisition

	Pre Acquisition	Post Acquisition
Ordinary Shares	472,592,093	482,592,093
Options	22,950,000 (1)	22,950,000 (1)
Performance Shares	33,500,000(2)	68,500,000(3)
SARS	11,700,000	11,700,000

Notes (1) Options, (2) Performance Shares as per Highland Gold Acquisitions see ASX release dated 31st March 2025 Infinity Acquires Gold Projects, (3) Performance Shares as per Mitta Mitta Option and Purchase Agreement.

Note 1 Options

Number Granted	*Expiry Date*	*Exercise Price*
3,000,000	*15/12/25*	*$0.25*
6,983,000	*4/12/26*	*$0.15*
12,967,000	*4/12/26*	*$0.25*

Schedule 4

Corryong Transaction terms and conditions

- Infinity will make an initial payment of $1 cash to secure exclusivity and be granted the option ('**Option**')
- In order to exercise the Option, Infinity will pay $100,000 cash and will enter into an earn-in joint venture ('**Joint Venture**') on the following terms and conditions:

(1) Infinity may earn 51% by spending $1.0 million over 3 years;

(2) Infinity may earn a further 29% (total 80%) by spending a further $2.5 million over the next 2 years ($3.5 million total within 5 years from the date of exercising the Option).

(3) The Joint Venture will work with Infinity as the operator, managing and controlling all exploration activities and management of the Corryong project. During the Joint Venture period, Infinity may earn up to an 80% interest in the Corryong project. Upon reaching a financial investment decision (**FID**), Dart will be required to contribute pro rata or dilute to a 2% Net Smelter Royalty ('**NSR**').

(4) Dart's interest will be free carried throughout the term of the joint venture until FID, when it can elect to contribute pro-rata in expenditure on the Project or dilute to a 2% NSR.

(5) Subject to the exercise of the Option, Infinity be required to pay deferred consideration of $2 million in cash or shares at Infinity' sole election upon the publishing of a 1 million oz gold or gold equivalent using gold, silver, copper and molybdenum JORC resource with a grade of no less than 0.5 g/t of gold or gold equivalent (at current share price equivalent to 100,000,000 shares are issued as outlined below;

Tranche	Consideration Fully paid ordinary shares in Infinity	Vesting Condition	Expiry Date
A	$2 million cash or up to 100,000,000	The Company announcing to ASX the definition of a JORC Code compliant Mineral Resource Estimate on a Tenement within the Project in excess of 1,000,000 oz gold > 0.5 g/t or gold equivalent (as defined in the JORC Code) using Au, Ag, Cu and Mo.	4 years from the date of issue

Issue of Shares are subject to regulatory and shareholder approvals. Infinity will make an election upon the exercise of the option as to whether the deferred consideration shares will be subject to shareholder approval or will utilise placement capacity available as at the date of the exercise of the option.

Schedule 5

Capital Structure post Corryong earn-in and delineation of 1.0 million oz Au eqv JORC resource

	Pre-Acquisition (assuming Mitta Mitta consideration has been issued)	Post Acquisition (assuming Infinity elects to issue deferred consideration as cash)	Post Acquisition (assuming Inifinity elects to issue deferred consideration as Shares)
Ordinary Shares	482,592,093	482,592,093	484,592,093[4]
Options	22,950,000 [1]	22,950,000 [1]	22,950,000 [1]
Performance Rights	68,500,000[3]	68,500,000	68,500,000
SARS	11,700,000	11,700,000	11,700,000

Notes (1) Options, (2) Performance Shares as per Highland Gold Acquisitions see ASX release dated 31st March 2025 Infinity Acquires Gold Projects, (3) Performance Shares as per Mitta Mitta Option and Purchase Agreement.(4) Shares as per Corryong JV Agreement

Note 1 Options

Number Granted	*Expiry Date*	*Exercise Price*
3,000,000	*15/12/25*	*$0.25*

Appendix 1 – JORC 2012 Table 1

Section 1: Sampling Techniques and Data Mitta Mitta Project

Granite Flat and Mitta Mitta Sand Creek Prospects

- **Granite Flat** *All information pertaining to sampling techniques and data taken verbatim from Dart Mining ASX release 8/3/2021 and taken as read. Infinity has no reason to doubt information as provided by Dart Mining N.L.*
- **Sandy Creek** *All information pertaining to sampling techniques and data taken verbatim from Dart Mining ASX release 16/2/2021 and taken as read. Infinity has no reason to doubt information as provided by Dart Mining N.L.*

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• **Granite Flat and Sandy Creek** • Rotary Air Blast (RAB) drilling was used to obtain bulk samples (~15kg) which were collected in plastic bags and examined for lithological logging purposes. • Samples off the cyclone were split via riffle splitter and collected in a calico bag, which was removed every 1m to produce a 1m composite sample (~1.5kg). The cyclone was cleaned out at the end of each hole and periodically during drilling. • In interpreted mineralized or altered zones, 1m samples were submitted for analysis. • In interpreted unmineralized zones, 2m sample composites were submitted. • Samples submitted to ALS were whole sample crushed to 70% <2mm, riffle split/rotary split off 1kg, pulverised to >85% passing 75 microns, then assayed by ALS method AU-226 (50g sample aliquot by fire assay). • Certified Reference Material OREAS 235, OREAS 237 and OREAS 245 as well as CRM blank OREAS C27c were inserted every 10 samples as part of the QA/QC system.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• **Granite Flat** • 42 RAB drillholes were drilled by EDrill Pty Ltd over the strike extent of mineralized structures. • **Sandy Creek** • 43 RAB drillholes were drilled by EDrill Pty Ltd over the strike extent of mineralized structures. • **Granite Flat and Sandy Creek** • Face sampling 90mm RAB drilling.

Criteria	JORC Code explanation	Commentary
		• Holes surveyed using a Eastman single shot camera for collar shots. Verified using clinometer and compass survey rods. • All drill-related data are referenced to the original ASX report by date published. All details appear in the original report.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• **Granite Flat and Sandy Creek** • Each 1m sample was weighed and results recorded to monitor sample recovery - a high average recovery was achieved in all holes. • Experienced geologists ensured best drilling and sampling practices were maintained. • Experienced drillers ensured best drilling and sampling practices were maintained, including pausing drilling between sample intervals to ensure all sample is out of the system and regular cleaning of the sampling equipment. • There was no observable relationship between sample recovery and grade.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• **Granite Flat and Granite Flat** • Drill chips were geologically logged at 1m intervals for lithology (including quartz types and percentages) alteration and mineralisation, and drilling conditions. • Representative chips from each metre were collected in chip trays. Chip trays were photographed. • 100% of the drilling was logged.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being*	• **Granite Flat and Sandy Creek** • Samples were collected from a riffle splitter from the bulk sample bag after removal from the cyclone. • Samples from all intervals were collected as 1m composite samples at the splitting stage at the drill site. • 12.5% of the sample was split with the remainder collected in the residue bags. • The majority of samples were dry in the shallow holes, there were 4 wet samples collected during the program. • The sampling procedure is appropriate for the mineralisation style of disseminated gold. • The samples were sent to ALS Laboratories, Pooraka S.A.

Criteria	JORC Code explanation	Commentary
	sampled.	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• **Granite Flat** • Samples were submitted to ALS Chemex and analysed for gold using ALS Method AU-AA26 (fire assay is considered a total extraction technique for gold) and ME-MS61 (four acid digest is considered a total extraction technique for copper exploration), Cu-OG62 (ore grade copper by three acid digest and HCl leach) and Ag-OG62 (ore grade silver by three acid digest and HCl leach). These techniques are appropriate and considered a total extraction technique for Au and Cu. • Samples were whole sample crushed pulverised and assayed by ALS method AU-AA26, ME-MS61, Cu-OG62 and Ag-OG62. • Au standards OREAS 235, OREAS 237 and OREAS 245 as along with porphyry copper standards OREAS 503d, OREAS 504c and OREAS 605, as well as rhyodacite blanks (OREAS C27e) were included every 10 samples as part of the internal QA/QC system. All results are within expected confidence limits. • **Sandy Creek** • Samples were submitted to ALS Chemex and analysed for gold using ALS Method AU-AA26 (fire assay is considered a total extraction technique for gold). Thes techniques are appropriate and considered a total extraction technique for Au. • Samples were whole sample crushed, pulverised and assayed by ALS method AU-AA26. • Au standards OREAS 235, OREAS 237 and OREAS 245 as well as rhyodacite blanks (OREAS C27c) were included every 10 samples as part of the internal QA/QC system. All results are within expected confidence limits. • **Granite Flat and Sandy Creek** • A field duplicate sample was collected every 10 samples and analysed within the same sample run. • ALS conducted their own internal laboratory checks. • Laboratory blanks, standards are reviewed per batch to monitor accuracy and precision.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• **Granite Flat and Sandy Creek** • The laboratory supplies all assay data in an export to a CSV file. Ther aw data is edited to separate duplicates and CRM results ot a QA/QC tab in the CSV file reviewed. • Verification of significant intersections were made by alternative company personnel. • No independent review of assay data has been carried out. • Data were logged onto paper and transferred to a spreadsheet and checked. • Electronic-only assay data is imported into a spreadsheet from the laboratory's electronic data. • No holes were twinned at this early exploration stage. • Below detection limit data is identified using < character followed by a detection limit.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• **Granite Flat** • The location of drill hole collars and geological mapping used a Garmin 66i GPS using the MGA94 Grid Datum (Zone 55) with the topographic control taken from the GPS. Accuracy is variable but maintained <3m during the mapping process with constant visual quality assessment conducted. • **Sandy Creek** • The location of drill hole collars and geological mapping used a Garmin 62S GPS using the MGA94 Grid Datum (Zone 55) with the topographic control taken from the GPS. Accuracy is variable but maintained <5m during the mapping process with constant visual quality assessment conducted. • Hand held GPS is used to survey a control point and drill collar positions are then measured by tape and compass relative to the GPS control. The accuracy between holes is <2m but absolute accuracy is relative to the original GPS control point at <10m. • **Granite Flat and Sandy Creek** • Because of the high probability of RAB hole collapse, and the short length of holes, collar shots were used to survey hole orientation. • All maps, plans and data are on an MGA datum and GDA94 Zone 55 projection.

Criteria	JORC Code explanation	Commentary
		• Elevation is established from the GPS control point.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• **Granite Flat and Sandy Creek** • Drill sites were restricted to existing tracks. It was not intended to establish a drill spacing for resource estimation although these holes may be used at a later date. • 1m assay composites were collected at the splitter on the drill site. This sample interval is considered appropriate for the style of gold mineralisation tested. • All drill related data are referenced to the original ASX report by date published. All details appear in the original report.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• **Granite Flat and Sandy Creek** • Drilling was restricted to existing tracks. However in all cases it was possible to drill at a high angle to the host structures, and achieve a suitable orientation that cross-cuts the mineralisation. True width intersections are provided in cross sections, there appears to be no relationship between drill orientation and mineralisation grades. • Due to the steep grade of tracks and topography, hole orientation was limited or dictated by landscape physiology in some instances.
Sample security	• *The measures taken to ensure sample security.*	• **Granite Flat and Sandy Creek** • All samples submitted for analysis are placed in sealed poly-weave bags and delivered to a commercial transport company for delivery to the laboratory. Any evidence of sample damage or tampering is immediately reported by the laboratory to the company and a decision is made as to the integrity of the samples and the remaining samples within the damaged/tampered bags.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• **Granite Flat and Sandy Creek** • An internal review of procedures, operations sampling techniques and analytical techniques was made by Dart Mining.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• **Granite Flat** • All tenements were in good standing at time of reporting (March 2021, February 2022, April 2024) and upon inspection of GeoVic public reporting portal at time of this release (April 2025). • **Sandy Creek** • All tenements were in good standing at time of reporting (February 2021) and upon inspection of GeoVic public reporting portal at time of this release (April 2025).
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• **Granite Flat** • Granite Flat reef claims first date to 1856, with most lodged 1877-1878. Between 1986 and 1988 the Granite Flat area was worked by Meltech Ltd, with soil sampling identifying strong geochemical anomalies and six diamond holes were completed. From 1990 to 1995 CRA Exploration (now Rio Tinto) completed extensive exploration in the search for a bulk mineable resource. This included 18 costeans, 32 RC drillholes and 13 diamond drillholes, along with aeromagnetic, ground magnetic and Induce Polarity (IP) surveys of the site.In 1994 Perseverance Mining Ltd entered into a joint-venture agreement with CRA Exploration, working the prospect from 1996 to 1999, completing an additional 20 RC drill holes. Minor stream sediment and soil sampling was completed by Synergy Metals Ltd and Glen Wills Gold Mines NL between 2006-2016. • **Sandy Creek** • The Sandy Creek goldfield has previously been explored to establish the remaining alluvial potential and limited effort tot review reef style historic mines with surface and underground mapping and sampling carried out (EL 873) BHP Minerals Ltd, 1980-1982: EL1463. Tallangalook Ltd, 1984-1988: EL3574, Exminco, 1993-1994: EL4039, Northern Copper Ltd, 1996-1997: EL4812,

Criteria	JORC Code explanation	Commentary
		Goldsearch Ltd, 2004-2008: EL5241, Golden Deeps Ltd, 2009-2011). All previous exploration efforts have focused on narrow-veing quartz potential, with very little focus on Alteration within the granite and minro structural analysis. Dart Mining is the first explorer to recognize the roof pendant style of mineralisation and assesses the structural control on the distribution of mineralisation. Tallangalook Ltd and Goldsearch Ltd undertook some basic geological maping of the Sandy Crek area. Tallangalook Ltd dug and sampled costeans across the workings. Goldsearch Ltd drilled 3 short diamond holes but terminated the holes before hitting mineralisation.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• **Granite Flat** • EL6277 is located in the Omeo structural zone of the Lachlan Fold Belt in eastern Victoria. The EL is underlain by metamorphosed lower Ordovician Pinnak Sandstone and its higher grade metamorphic equivalents Omeo Metamorphic Complex to the south. The Banimboola Quart Monzodiorite (BQM) intruded during the early Devonian and is a highly magnetic I-type composite pluton that has been placed in the Boggy Plain Supersuite. Aeromagnetic data from Geo Vic database indicates that BQM is a composite pluton with a variable magnetic signature. • **Sandy Creek** • The Sandy Creek goldfield was a traditional narrow vein, high grade (free gold) reef style with a minor alluvial gold footprint. Dart Mining recognized some gold mineralisation is related to disseminated sulphides in altered granites along structurally controlled intersections within a metasedimentary roof pendant above the Yabba Granite.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level*	• **Granite Flat** • Appendix 1 provides drill hole locations and hole orientation data in the body of the report. • All downhole weighted average gold data was quoted as significant intersections provided down hole widths and calculated using a lower cut-off grade of 0.2 g/t Au and

Criteria	JORC Code explanation	Commentary
	– *elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	1000ppm Cu, with no more than 2m of internal dilution. • **Sandy Creek** • Appendix 1 provides all drillhole information. • All downhole weighted average gold data was quoted as significant intersections provided down hole widths and calculated using a lower cut-off grade of 0.5 g/t Au and no more than 1m of internal dilution. • **Granite Flat and Sandy Creek** • All drill -related data are referenced to the original ASX report by date published. All details appear in the original report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• **Granite Flat** • All downhole weighted average gold data was quoted as significant intersections provided down hole widths and calculated using a lower cut-off grade of 0.2 g/t Au and 1000ppm Cu, with no more than 2m of internal dilution in each drill hole. Gold, copper, silver and zinc assay data is tabulated in Table B for all holes. assay data is tabulated in Appendix A for all holes. The nominal sample length is potentially mineralized intervals is 1m with any 1m sample lengths in unmineralized sections requiring a length weighted average technique to be used for reporting intersections. • **Sandy Creek** • All downhole weighted average gold grade data quoted as significant intersections is calculated using a lower cut-off grade of 0.5 g/t Au and no more than 1m internal dilution in each drill hole. Gold assay data is tabulated in Appendix A for all holes. The nominal sample length is potentially mineralized intervals is 1m with any 2m sample lengths in unmineralized sections requiring a length weighted average technique to be used for reporting intersections.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the*	• **Granite Flat and Sandy Creek** • The relationship between the drill hole and the geometry of the mineralized structures is clearly presented in a series of summary cross sections and drill plans. The angle between the drill hole, down hole average grades are also represented on these drill sections and are representative of current

Criteria	JORC Code explanation	Commentary
	down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	geological interpretation, this interpretation may change over time as more drilling information becomes available. Structural interpretation is constrained with surface geological mapping and downhole lithology logging
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• **Granite Flat** • Maps showing the tenement locations, drill holes and rock chip samples are included in the body of this report. • **Sandy Creek** • Maps showing the tenement locations, drill holes and rock chip samples are included in the body of this report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• **Granite Flat** • Both summary (weighted average) grade intersections and full assay data is provided as cross sections and tabulated data reference in the body of the report. • **Sandy Creek** • Both summary (weighted average) grade intersections and full assay data is provided as cross sections and tabulated data reference in the body of the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• **Granite Flat** • A full data compilation of all historic exploration programs has not yet been conducted by Infinity, as this ongoing work is conducted, any material results uncovered will be reported by the Company. • **Sandy Creek** • A full data compilation of all historic exploration programs has not yet been conducted by Infinity, as this ongoing work is conducted, any material results uncovered will be reported by the Company.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is*	• **Granite Flat** • Infinity will review all information and make an assessment on whether it will elect to exercise the Option to Purchase. • **Sandy Creek** • Infinity will review all information and make an assessment on whether it will elect to exercise the Option to commence Earn-In Joint Venture.

Criteria	JORC Code explanation	Commentary
	not commercially sensitive.

Appendix 2 – JORC 2012 Table 1

Section 1: Sampling Techniques and Data Corryong Project

- **Corryong Project** *All information pertaining to sampling techniques and data taken verbatim from Dart Mining ASX release 23 April 2012, 5 August 2012 and 18 December 2012 and taken as read. Infinity has no reason to doubt information as provided by Dart Mining. Work was conducted in accordance with JORC 2004 reporting standards which were relevant at the time by Dart Mining.*

- ***Information required under JORC FAQ 36:***
  - *The information has been reported by the former owner (Dart Mining) rather than Infinity.*
  - *The information was previously released by Dart on 23 April 2012, 5 August 2012 and 18 December 2012 and is available on the Dart Mining ASX Market Announcement Platform (ASX:DTM).*
  - *The previous announcements were prepared under JORC 2004 and not JORC 2004.*
  - *The Company has reviewed and compiled the relevant information and set out the available qualify assurance and quality control measures assessed to date. The Company has not to date identified any instances which causes it to question the reliability of the information provided by Dart Mining.*
  - *No more recent exploration results or data pertaining to the Corryong Project are known to the Company.*
  - *The Company will determine what further exploration and evaluation work is required after undertaking further desktop diligence determining whether or not to exercise the Option.*
  - *The Competent Person, Mr Adrian Byass has reviewed the information in the market announcement and confirms that it is an accurate representation of the available data and studies for the Corryong Project.*
  - *A cautionary statement is included earlier in the announcement.*

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual*	• **Corryong** • The methods of collection for all the historical rock chip samples and drilling is unknown. • Infinity has not assessed measures taken to ensure sample representivity. • Work was conducted un JORC 2004 reporting standards and reported to the ASX 18th December 2012 by Dart Mining. • Infinity has not assessed aspects of the determination of mineralisation that are Material to the Public Report.

Criteria	JORC Code explanation	Commentary
	commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• **Corryong** • The drill holes reported here were completed by Dart Mining by 2012. A Revers Circulation (RC) and a diamond drill rig was used.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• **Corryong** • Infinity has not assessed the drilling recovery results from the historical drilling campaigns. • Infinity has not assessed the measures taken to maximise sample recovery and ensure representative nature of the samples. • Infinity has not assessed the relationship between sample recovery and grade and whether sample bias may have occurred.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• **Corryong** • Geological and geotechnical logging was completed, but details on drill logging techniques were not assessed. • There are no JORC 2012 Mineral Resources reported for any of the tenements. A historic JORC 2004 Mineral Resource was estimated but is not reported in this release • Infinity has not assessed the nature of the drill logging. • Infinity has not assessed the total length and percentage of the relevant intersections logged.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half*	• **Corryong** • Infinity has not assessed the sub-sampling techniques and sample preparation used for any of the geochemical exploration and drilling campaigns.

Criteria	JORC Code explanation	Commentary
	sampling. • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• **Corryong** • Infinity has not assessed the quality of the assay data and laboratory tests for any of the geochemical exploration and drilling campaigns.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• **Corryong** • Infinity has not verified sampling and assaying data.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• **Corryong** • Infinity has not assessed the accuracy and quality of surveys used to locate sample sites and drillholes. • The grid system used is GDA94 (Zone 55). • No Mineral Resource estimates are presented in this report and the quality of topographic control is not material to the review.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• **Corryong** • Data spacing for reporting varies for different sampling methods e.g. soil sampling and stream sediment sampling. • No Mineral Resource estimates are presented in this report. • No sample compositing has been applied.

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• **Corryong** • The historical geochemical surface sampling programs were commonly oriented perpendicular to the prevailing strike of the geological rocks. • Infinity has not assessed the relationship between the drilling orientation and the orientation of key mineralised structure.
Sample security	• *The measures taken to ensure sample security.*	• **Corryong** • Infinity has not assessed measures taken to ensure sample security.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• **Corryong** • Infinity has not assessed results of any audits or reviews of sampling techniques and data.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• **Corryong** • Inifinity Lithium has entered into an Option to commence an earn-in Joint Venture over the following tenements. All public information has been taken from Geo Vic online portal. • The ELs are centred approximately 20km south of the town of Corryong, approximately 350 km east-northeast of Melbourne. • The ELs largely lie within farming country and State Forest of eastern Victoria. • Several Victorian Government reserves and restricted areas are in the region, including the Alpine National Park. • The tenements are in active and registered on Geo Vic online portal, no known impediments exist.Infinity will be conducting due diligence as to the status of the tenements including Retention Licence 6616.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• **Corryong** • Many historical exploration programs have been undertaken on the ELs between 1965 and 2012.

Criteria	JORC Code explanation	Commentary
		• Historical exploration sampling programs include soil sampling surveys, stream sediment surveys, rock chip sampling, auger drilling, RAB drilling, air core drilling, percussion drilling and diamond drilling.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• **Corryong** • The ELs lie within the northeastern portion of the Palaeozoic Lachlan Fold Belt (LFB) of eastern Australia, which is host to historical mining prospects and mineral fields. The mineral occurrences targeted are intrusive porphyry targets likened to the Henderson-Climax molybdenum rich type (USA). • The tenement package was acquired to explore for economic gold and base metal porphyry style mineralisation.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• **Corryong** • Collar information for drill holes reported in this release are contained in Tables A & B. • Infinity is not aware of the methods used to confirm down hole survey, collar location.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical*	• **Corryong** • Infinity has not assessed data aggregation methods used by previous tenement holders to report Exploration Results. • The drilling results presented in this report have been length weighted. • No data aggregation is included in this report. • No metal equivalents are reported here.

Criteria	JORC Code explanation	Commentary
	examples of such aggregations should be shown in detail. • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• **Corryong** • Infinity is not able to comment on the true widths of intercepts. • As above
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• **Corryong** • Maps showing the tenement locations, drill holes are included in the body of this report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• **Corryong** • A full data compilation of all historic exploration programs has not yet been conducted by Infinity, as this ongoing work is conducted, any material results uncovered will be reported by the Company.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• **Corryong** • A full data compilation of all historic exploration programs has not yet been conducted by Infinity, as this ongoing work is conducted, any material results uncovered will be reported by the Company.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or*	• **Corryong** • Infinity is undertaking due diligence and will make a decision within 60 days if it wishes to

Criteria	JORC Code explanation	Commentary
	large-scale step-out drilling). • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	exercise the Option and enter into an earn-in Joint Venture on the tenements and undertake porphyry exploration.

Drill collar locations for Mt Unicorn shown in Figure 12.
