25 JUNE 2025

CORRECTION TO ASX ANNOUNCEMENT

Sheffield Resources Limited ("Sheffield" or **"the Company") (ASX: SFX)** wishes to advise of a correction to the ASX announcement released on 23 June 2025.

On page 15, the previous announcement inadvertently referred to Exploration Targets and has been updated to refer to the Mineral Resources. This has been corrected in the attached update herein.

This ASX announcement has been authorised for release by the Company's Board of Directors.

ASX AND MEDIA RELEASE
25 JUNE 2025

SOUTH ATLANTIC PROJECT: MAIDEN MINERAL RESOURCE & RETIRO LICENCE APPROVAL

HIGHLIGHTS

- **Maiden Mineral Resource for South Atlantic Project of 771 million tonnes (Mt) @ 3.0% total heavy mineral (THM) (Indicated and Inferred), consistent with the prior Exploration Target**
- **Installation Licence approved for Central Retiro, with Rio Grande Mineração progressing a Mining Decree for the initial project area**

Sheffield Resources Limited ("Sheffield" or **"the Company") (ASX: SFX)** is pleased to advise the maiden Mineral Resource of 771Mt @ 3.0% THM (Indicated and Inferred) for 23Mt of contained THM for the combined Retiro and Bujuru projects at the South Atlantic Project in Brazil. (Table 1, Figure 1).

Additionally, Rio Grande Mineração S/A (RGM) has been granted an Installation Licence for the Central Retiro area of interest, part of the greater Retiro deposit, paving the way for RGM to progress a Mining Decree for the initial project area.

Ongoing activities at RGM are focused on securing the Central Retiro mining decree, progressing project related approvals and the pre-feasibility study.

Table 1: South Atlantic Project Mineral Resource Summary

Summary of Mineral Resource (1)								THM Assemblage (2)					
Deposit	Mineral Resource Category	Material (Mt)	In Situ THM (Mt)	BD (gcm3)	THM (%)	SLIMES (%)	OS (%)	ILM (%)	ILMA (%)	ZIR (%)	RUT (%)	LX (%)	OTHERS (%)

Grand Total		**771**	**22.9**	**1.6**	**3.0**	**3**	**0.2**	**45**	**10**	**6**	**3**	**1**	**36**

Notes:

(1) Mineral Resource reported at a cut-off grade of 1% THM.
(2) Mineral assemblage is reported as a percentage of in situ HM content.
(3) Totals may vary subject to rounding.

Commentary

Sheffield Executive Chair, Bruce Griffin, said: *"We're extremely pleased that the milestone of a maiden Mineral Resource estimate for the South Atlantic Project in Brazil has been achieved. The team at Rio Grande Mineração has worked diligently to deliver an outstanding result for the Retiro and Bujuru project areas. We also welcome the approval of the Installation Licence for Central Retiro, enabling Rio Grande Mineração to now progress the award of a Mining Decree."*

South Atlantic Project

The South Atlantic Project is located within the Rio Grande do Sul Coastal Plain, a region located in the southernmost state of Brazil, Rio Grande do Sul, along the coast of the Atlantic Ocean. The tenements are held by RGM. Four main deposits have been identified within the project area: Retiro, Estreito, Capao do Meio and Bujuru with a Mineral Resource estimate developed for both the Retiro and Bujuru deposits.

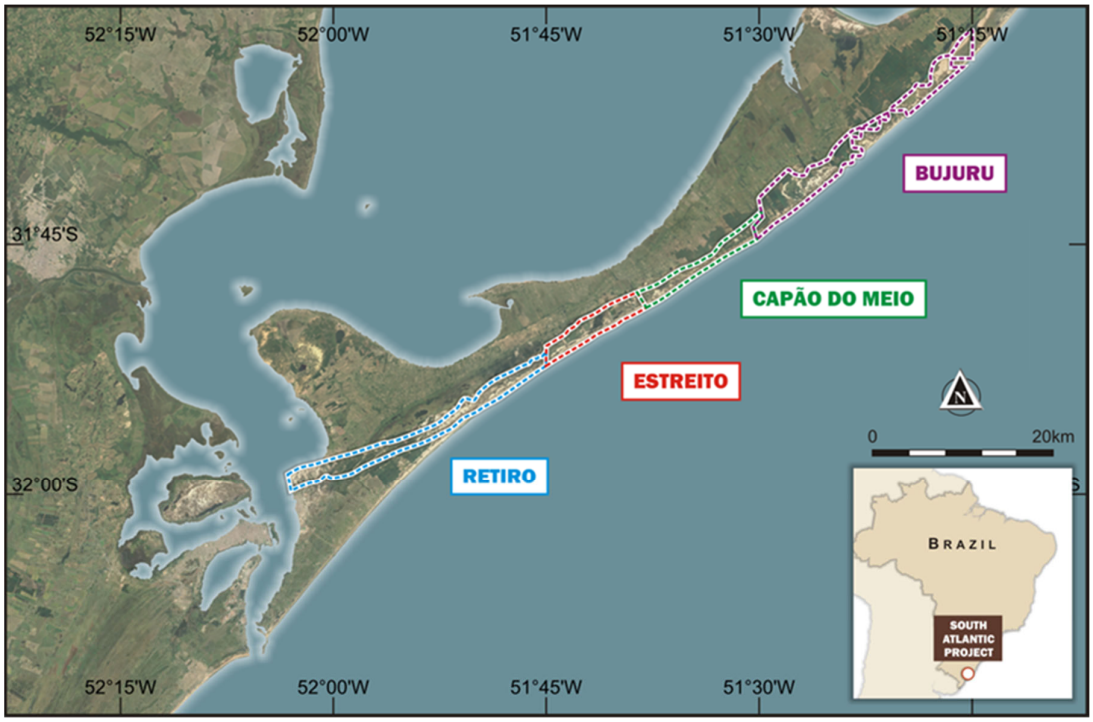

Figure 1: South Atlantic Project location

In 2022, a program of sonic drilling was carried out by RGM over Retiro and Bujuru, with trial pits also carried out at Bujuru, as part of a campaign to reconcile grade differences between historical drilling prior to 2014, the 2014 RC/AC drilling campaign, and more recent bulk test work programs. The sonic drilling program proved successful, with comparable continuity of grade between drill programs. RGM completed an extensive RC drill campaign in 2024, infilling existing drill lines across both the Retiro and Bujuru deposits, improving confidence in the drill grid spacing that informs the Mineral Resource. The mineralisation is relatively straight forward whereby the high grade, low slimes material is from surface, with the thickness of mineralisation for both Retiro and Bujuru deposits varying typically between a few metres to up to 10 metres thick, across a strike length exceeding 30km for each deposit.

South Atlantic Project – Mineral Resource Estimates

Chapter 5 of the ASX listing rules requires that Sheffield provide all information that is material to understanding the Mineral Resource estimates relevant to the South Atlantic Project, including the sampling techniques and data, as well as any material information in respect of the drill-holes. This information is included below, and in the JORC Code Table 1 attached to this announcement within Appendix 1.

Retiro

The Retiro Mineral Resource estimate has been developed from all available geological, drill hole and assay information. Requisite checks and balances have been applied to supporting information and all care has been taken to prepare the Mineral Resource estimates that reflect both conventional mining

methodologies and economic cut-off grade considerations. A map showing the Retiro deposit coloured on THM using a cut-off grade of 1% THM, constrained to the tenure is shown below in Figure 2.

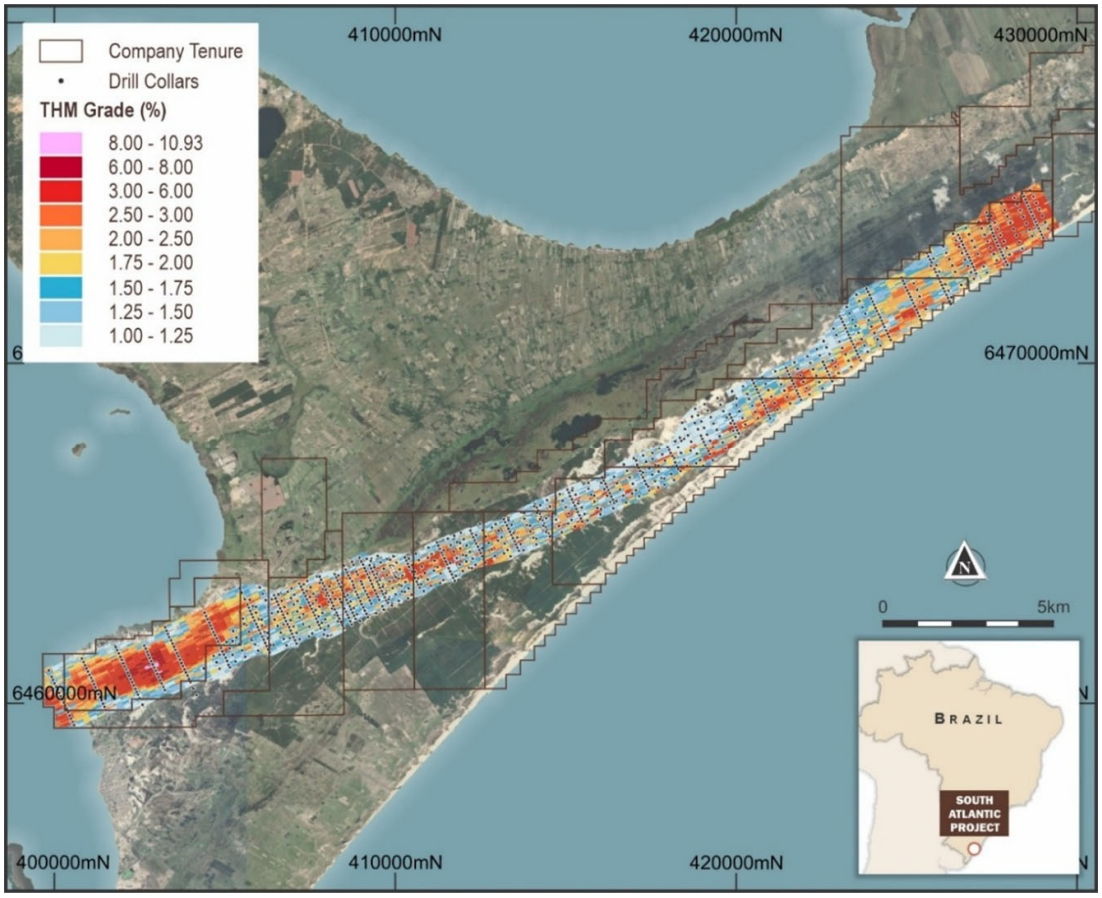

Figure 2: Retiro deposit THM grade (>1% THM cut-off grade)

The Retiro deposit Mineral Resource estimate is reported at a cut-off grade of 1% HM and is presented below in Table 2. The table conforms to guidelines set out in JORC Code (2012) and is formatted for internal and external public reporting.

At a cut-off grade of 1% THM the Retiro deposit comprises of a total Mineral Resource of 429Mt @ 3.1% THM, 0.6% slimes and 0.1% oversize containing 13.3Mt of THM with an assemblage of 41% ilmenite, 11% altered ilmenite, 6% zircon, 3% rutile and 1% leucoxene.

Table 2: Retiro deposit Mineral Resource estimate (June 2025)

SUMMARY OF MINERAL RESOURCE (1) (HM assemblage)

Deposit	Classification	Cut off (THM%)	Material (Mt)	In Situ HM (Mt)	THM (%)	HM Assemblage					Non Valuable HM (%)
						Ilmenite (%)	Altered Ilmenite (%)	Zircon (%)	HiTi / Rutile (%)	Leuco -xene (%)	
Retiro	Indicated	1.0	316	9.6	3.0	41	12	6	3	1	37
	Inferred	1.0	113	3.7	3.3	41	9	6	3	1	41
	Total	**1.0**	**429**	**13.3**	**3.1**	**41**	**11**	**6**	**3**	**1**	**38**

Notes:
(1) Mineral Resource reported at a cut-off grade of 1% THM.
(2) Mineral assemblage is reported as a percentage of in situ HM content.

The Retiro deposit JORC classification outline is presented in Figure 4. The cut-off grade used for reporting was based on the experience of the Competent Person and by considering the continuity of mineralisation at the cut-off grade as well as the inflection points on the grade tonnage curves (Figure 5) and considering potential future mining methodologies.

The Mineral Resource estimate has taken into consideration the drill hole spacing in plan view, as well as the sample support within domains, the size, weighting and distribution of the mineral assemblage and the variography. The deposit has been assigned a JORC classification of Indicated and Inferred and is supported by regular drill hole spacing that defines the geology and THM mineralisation distribution of trends, domain controlled variography and the distribution of mineral assemblage composites designed to appropriately identify various mineralogical domains specific to the Retiro deposit.

Scoping level pit optimisation studies have been carried out independently to the development of the Mineral Resource estimates, with studies reaffirming the selection of the cut-off grade for reporting. Utilising dredging as a potential mining method, and incorporating estimated operating costs, metallurgical recoveries and product revenues, the Retiro deposit has reasonable prospects for eventual economic extraction.

Bujuru

The Bujuru Mineral Resource estimate has been developed from all available geological, drill hole and assay information. Requisite checks and balances have been applied to supporting information and all care has been taken to prepare the Mineral Resource estimates that reflect both conventional mining methodologies and economic cut-off grade considerations. A map showing the Bujuru deposit coloured on THM using a cut-off grade of 1% THM, constrained to the tenure is shown below in Figure 3.

The Bujuru deposit Mineral Resource estimate is reported at a cut-off grade of 1% HM and is presented below in Table 3. The table conforms to guidelines set out in JORC Code (2012) and is formatted for internal and external public reporting.

At a cut-off grade of 1% THM the Bujuru deposit comprises of a total Mineral Resource of 343Mt @ 2.8% THM, 4.9% slimes and 0.2% OS containing 9.6Mt of THM with an assemblage of 51% ilmenite, 7% altered ilmenite, 6% zircon, 3% rutile and 0.3% leucoxene.

Table 3: Bujuru deposit Mineral Resource estimate (June 2025)

SUMMARY OF MINERAL RESOURCE (1) (HM assemblage)

Deposit	Classification	Cut off (THM %)	Material (Mt)	In Situ HM (Mt)	THM (%)	HM Assemblage					Non Valuable HM (%)
						Ilmenite (%)	Altered Ilmenite (%)	Zircon (%)	HiTi / Rutile (%)	Leuco -xene (%)	
Bujuru	Indicated	1.0	263	7.9	3.0	51	7	6	3	0.3	32
	Inferred	1.0	80	1.7	2.1	51	7	6	3	0.4	32
	Total	**1.0**	**343**	**9.6**	**2.8**	**51**	**7**	**6**	**3**	**0.3**	**32**

Notes:
(1) Mineral Resource reported at a cut-off grade of 1% THM
(2) Mineral assemblage is reported as a percentage of in situ HM content.

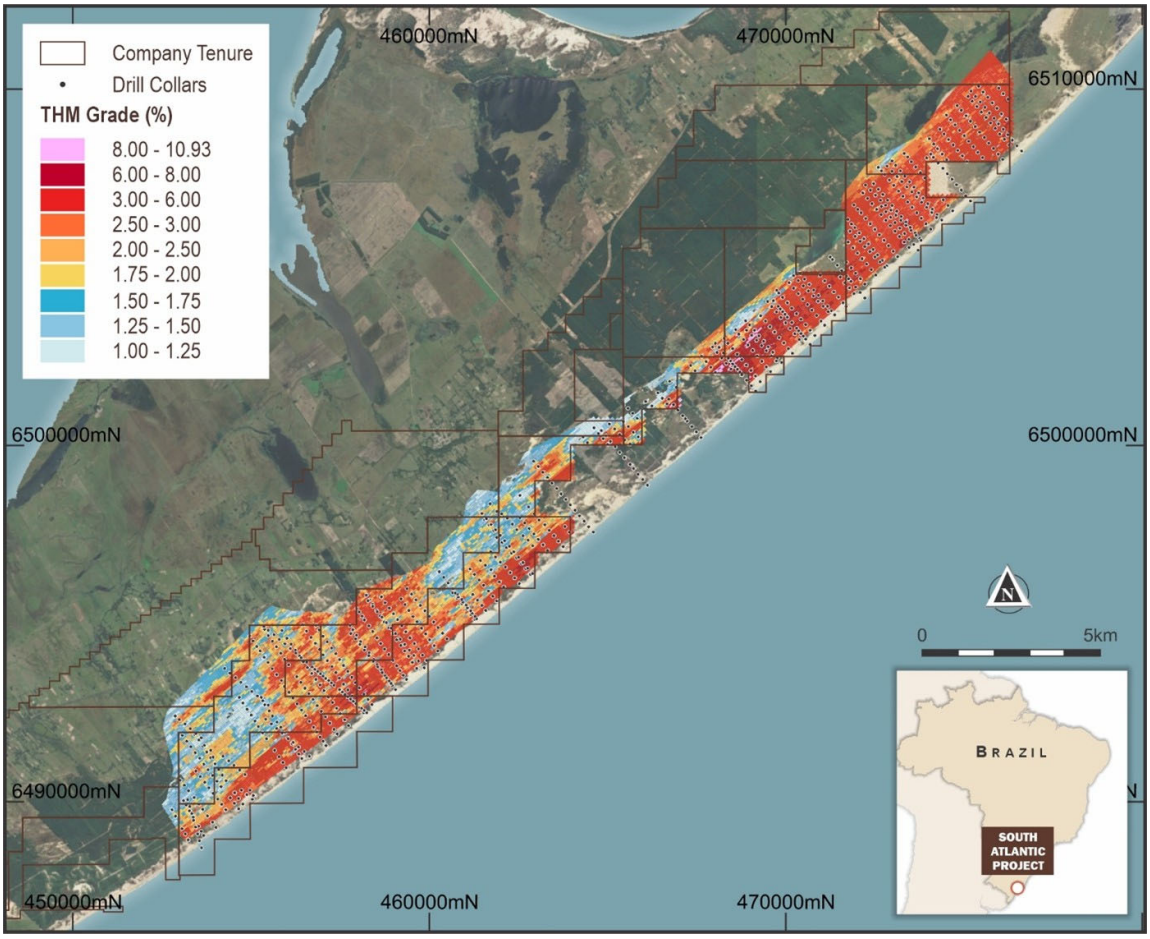

Figure 3: Bujuru deposit THM grade (>1% THM cut-off grade)

The Bujuru deposit JORC classification outline is presented in Figure 6. The THM cut-off grade used for reporting was based on the experience of the Competent Person and by considering the continuity of mineralisation at the cut-off grade as well as the inflection points on the grade tonnage curves (Figure 7) and considering potential future mining methodologies.

The Mineral Resource estimate has taken into consideration the drill hole spacing in plan view, as well as the sample support within domains, the size, weighting and distribution of the mineral assemblage and the variography. The deposit has been assigned a JORC Classification of Indicated and Inferred and is supported by regular drill hole spacing that defines the geology and THM mineralisation distribution of trends, domain controlled variography and the distribution of mineral assemblage composites designed to appropriately identify various mineralogical domains specific to the Bujuru deposit.

Scoping level Bujuru pit optimisation studies have been carried out independently to the development of the Mineral Resource estimates, with studies reaffirming the selection of the cut-off grade for reporting. Utilising dredging as a potential mining method, and incorporating estimated operating costs, metallurgical recoveries and product revenues, the Bujuru deposit has reasonable prospects for eventual economic extraction.

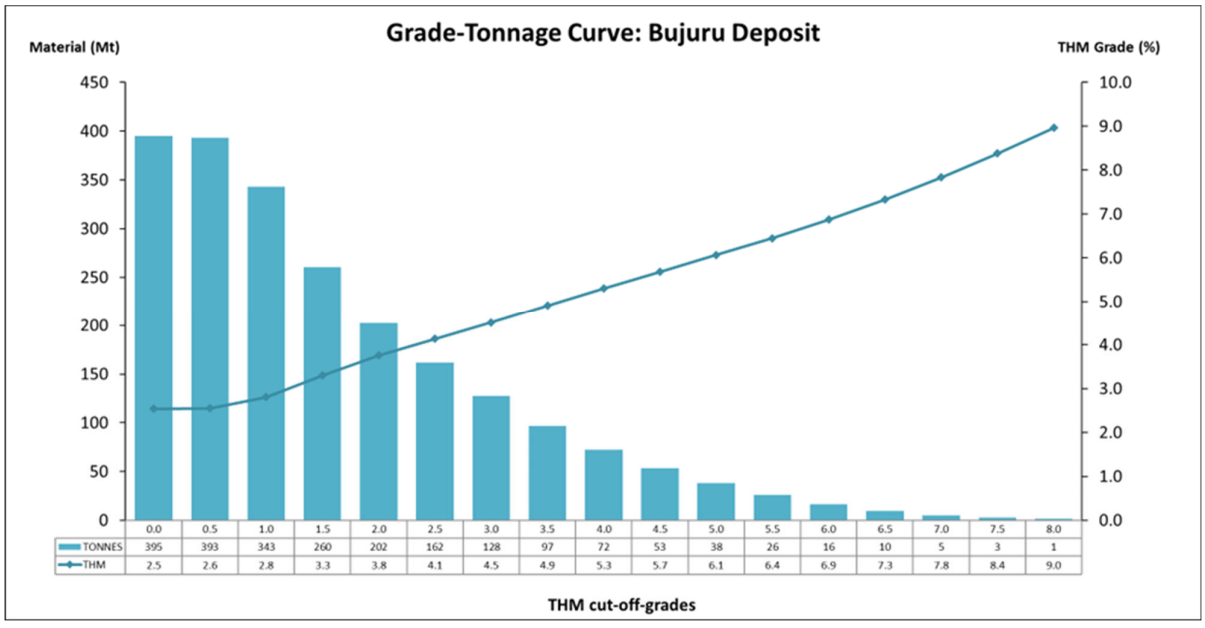

Figure 7: Bujuru deposit grade tonnage curve showing material tonnes versus THM grade

Summary of Mineral Resource Estimate and Reporting Criteria

As per ASX Listing Rule 5.8 and the 2012 JORC reporting guidelines, a summary of the material information used to estimate the Mineral Resource is detailed below (for more detail please refer to Table 1, Sections 1 to 3 included below in Appendix 1). Appendix 2 and Appendix 3 provide a list of composited drill holes (above cut-off grade of 1% THM) for the Retiro deposit and Bujuru deposit respectively.

Geology and geological interpretation

The geomorphology of the South Atlantic Project is controlled by the active shoreline which is dominated by sandy beaches and dunal systems host to the near surface, mineralised, fine grained, quartzose sands forming a Holocene aged barrier-lagoon system. The mineralisation of the South Atlantic Project is relatively straight forward whereby the high grade, low slimes material is from surface, typically 2m to 6m thick and is laterally continuous, following the general morphology of the natural form of the undulating beach/dunal systems. The South Atlantic Project is host to a reasonably consistent and continuous lithological sequence. The overall dimensions of the Retiro deposit are approximately 31km in length along strike and across strike varying typically between 1.2km and 2.2km. The dimensions for the Bujuru deposit are of similar length to Retiro and between 2.2km and 4.3km across strike. The thickness of mineralisation for both deposits varies typically between a few metres to up to 10 metres thick. The base of mineralisation is flat for Retiro which makes it even more amenable to dredging. The base of mineralisation at Bujuru is dipping from the landward to seaward side (north-west to south-east) at very low angles and also amenable for dredging.

The dunal/beach mineralised sands are typically from surface and are khaki in colour predominantly consisting of sub-rounded quartz, minor silt and occasional thin wisps of dark brown organic matter. The basal contact of the surficial mineral sands is marked by a silty sand layer which transitions quite sharply to grey coloured sediment much higher in silt percentage and low mineral sands content. Underlying the silty sand material is a dark grey clay unit which is firm but pliable and considered mostly homogenous sandy silt containing very minor mineral sands content. The clay unit thins moving south. Deeper holes within the project area intersected a lower greenish-grey sandy unit containing mica. Mineral sand content in this lower sandy unit has been identified as very minor at this stage of exploration.

The geomorphology of the Retiro deposit is consistent with the general local morphology of the South Atlantic Project area, forming part of the Holocene aged barrier-lagoon system. Much of the northern extents of the deposit is positioned parallel to the current active shoreline, consisting of active beach/dunal systems towards the active shoreline and a thin layer of aeolian sands along the in-land western edge of the deposit which can exhibit higher elevations to the material closer to the active-shoreline. The southern extents of the Retiro deposit are unique to the project, given that it traverses the barrier-lagoon system, moving away from the current active-shoreline so that its most southern extents terminate at the lagoon side of the barrier. This shift in the deposits trajectory, moving the predominant strike from south south-east to south-east targets a different mineralised sequence of the barrier-lagoon system. Due to this, there is a natural break in the high THM grade continuity along strike between the in-land, lagoonal southern extents of the Retiro deposit and the central, northern active near-shore extents, particularly when observing grades above a cut-off of >5% THM for the mineralised domain. The lower THM grade range below 2% THM maintains continuity between the southern extents of the deposit and the rest of the deposit for the mineralised domain.

The Bujuru deposit also forms part of the barrier-lagoon system, to the north of Retiro. However, unlike the Retiro deposit, the Bujuru deposit is defined by the active dunal/beach systems associated with the current active shoreline and does not transect the natural barrier between the active coast and lagoon.

The Bujuru deposit shows good continuity along strike, particularly in the central and northern extents of the deposit, associated with material nearest to the active shoreline. This is made particularly obvious when observing grades above a cut-off grade of 5% THM. The southern extents at a cut-off grade of 5% THM occur sporadically with less continuity both along and across strike. Most of the slimes content within the Bujuru deposit reside within the southern extents of the deposit whilst also extending north following the in-land north-east, south-west edge of the resource. The high slimes material constrained to the southern and inland extents juxtaposes the high THM content observed in the central and northern regions of the deposit within the mineralised domain.

Drilling techniques and hole spacing

The following drill spacing (XYZ) was used across the Retiro resource area (Figure 8):

The early drilling completed in 2000 (defined by hole ID naming convention 'RET') utilised a dominant drill grid spacing of 100m x 1,000m (XY) along strike for the entirety of the Retiro deposit. Follow-up drilling in 2014 (defined by hole ID naming convention 'S14') was completed using a 100m x 250m (XY) infill drill program to target the central region of the Retiro deposit, considered to be of high prospectivity, whilst both the southern and northern extents were completed using a wider spaced grid pattern of 200m x 500m (XY) and 500m x 500m (XY) at the extreme extents. The latest 2024 drilling predominantly consists of RC drilling (defined by hole ID naming convention 'RTAC') using a drill grid spacing of 200m x 400m (XY) to in-fill existing drilling along strike for the Central and northern extents of the Retiro deposit. RGM completed a small focused closed spaced sonic drill program within the central area of the Retiro deposit using a 25m spacing to be used to check close spaced grade variability and to check previous drilling down hole assays.

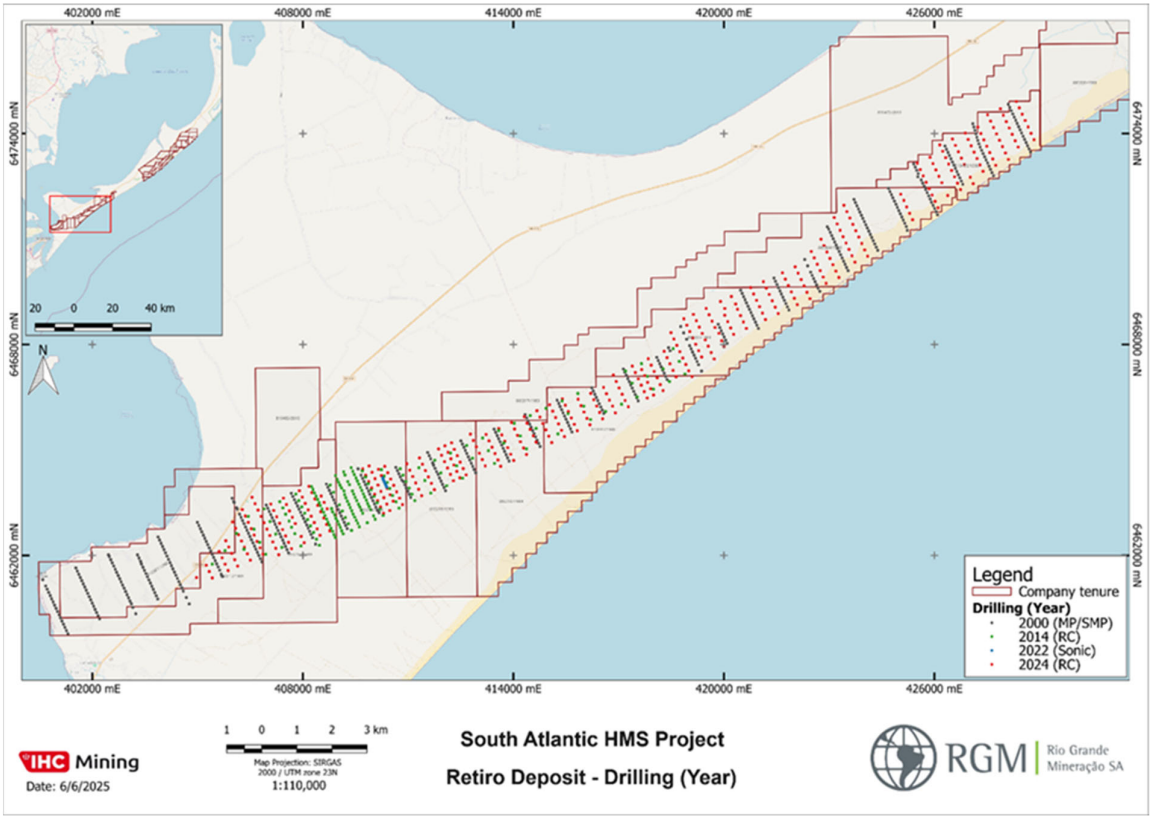

Figure 8: Retiro deposit drilling by year

The following drill spacing (XYZ) was used across the Bujuru resource area (Figure 9):

The Bujuru drill grid pattern consists of historic drilling (defined by hole ID naming convention 'PB') and the more recent 2024 RC in-fill drilling (defined by hole ID naming convention 'BJAC'). The historic drilling was completed at a relatively consistent drill grid spacing of 200m x 1,000m (XY) along strike in the deposits entirety.

The historic drilling has subsequently been in-filled during the RGM 2024 drill campaign utilising a dominant drill grid spacing 200m x 400m (XY) pattern. The latest drilling does exhibit some larger breaks between drill lines along strike between 1,200m and 2,500m as RGM used this opportunity to infill expected highly prospective regions of the deposit based on THM grade observed in the earlier drilling.

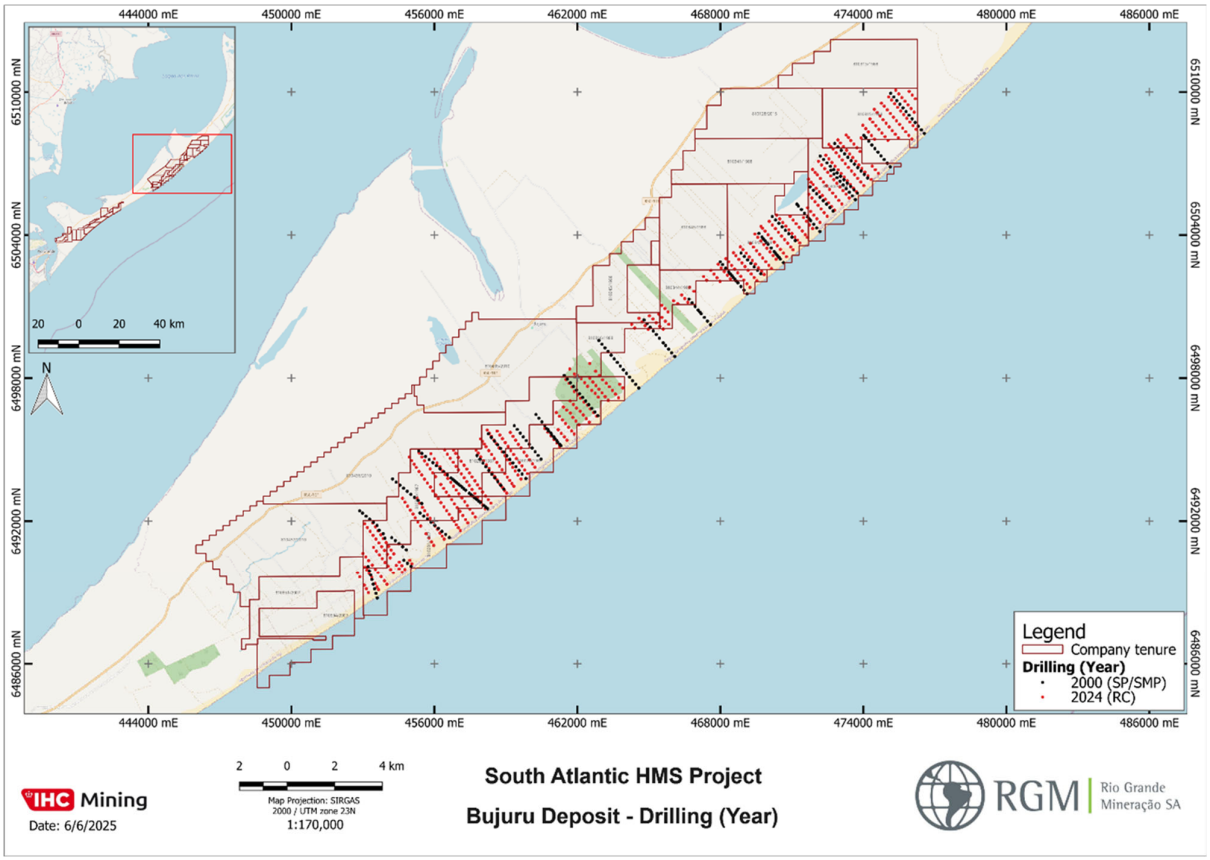

Figure 9: Bujuru deposit drilling by year

A total of 1,853 drill holes were used to develop the geological block models for the Retiro and Bujuru deposits. Of the 1,853 drill holes used, 1,016 drill holes are associated with the Retiro deposit whilst the remaining 837 drill holes are associated with the Bujuru deposit. The majority of the latest drilling completed across the South Atlantic Project used reverse circulation drilling techniques, complimented by a small target program of sonic drilling. The sonic drill holes were undertaken by RGM as a measure against existing drilling to confirm grade, down hole variability, closed spaced continuity and to rule out any potential for down hole contamination. The sonic drill program was conducted during August 2022, whilst the primary reverse circulation program was completed between February and August 2024.

Sampling and analysis method

The latest samples associated with the 2022 and 2024 work were assayed by Diamantina Laboratories in Perth, Western Australia. Diamantina Laboratories is considered a mineral sands industry leading laboratory. Individual split samples were dispatched from the RGM managed Bujuru sampling facility to Diamantina Laboratories and initially oven dried for up to 24 hours at an approximate temperature of 105°C to 110°C. Once dried, each sample was loosened until friable and split down to a 100g sub sample as required using a rotary splitter.

The 100g sub samples were then wet screened on a Sweco vibrating screen deck which consists of a top aperture of 1mm (to screen oversize material) and a bottom screen of 45 µm (to screen slimes fraction). The -1 mm to 45 µm sand fraction containing THM was then dried.

The sub split samples were then used for heavy liquid separation by use of funnels and a heavy liquid Tetrabromoethane (TBE) which has a density of between 2.92 gcm^3 and 2.96 gcm^3 to determine total heavy mineral (THM) content, which is an industry standard technique.

Mineral Assemblage Compositing

The mineral assemblage composites are designed to provide an indication of the mineralogical characteristics of the heavy mineral assemblage to enable preliminary economic evaluation to be undertaken for any given heavy mineral sand deposit. Mineral assemblage composites were developed by IHC Mining in Datamine Studio RM 3D window. Composite strings were generated to define individual composites using geological and stratigraphic interpretation of the primary drill holes, down hole logging and assaying. There is a distinct change in grade, particularly associated with THM and slimes, whereby the material closest to the active shoreline exhibit an uplift in THM grade along with lower slimes, whilst the material inland exhibits lower THM grade and higher slimes. The development of composites took this into consideration, separating these areas of change between the near shore material and inland material.

Samples from domains with similar geological and grade characteristics are then grouped together and then are then weighted on THM to ensure that each sample has a proportionate contribution to the overall composite weight. Individual composites were constrained by domain contacts which provides additional confidence in the mineral assemblage results being representative of the defined material. Preparing the mineral assemblage composites in this manner allows for composite results to be easily applied to the resource block model using field MACNUM by completing a nearest neighbour interpolation process and for those results to then be reported and weighted on THM in the final Mineral Resource estimate. A total of 32 individual mineral assemblage composites were prepared across the Retiro deposit area and an additional 25 individual mineral assemblage composites for the Bujuru deposit. Once all the sample compositing was completed, the sample identification and mineral assemblage composite number was submitted to IHC Mining laboratory for a bespoke mineral assemblage analysis. This method utilises magnetic separation and XRF on the various magnetic, paramagnetic and non-magnetic fractions to calculate mineral species such as ilmenite, rutile and zircon. These mineral assemblages are then validated with a regression analysis using QEMSCAN.

Estimation Methodology

Geological interpretation, wireframing, 3D block modelling and grade interpolation was carried out using Datamine Studio RM software. Construction of the geological grade model was based on a combination of coding model cells and drill holes below open wireframe surfaces, including topography and basement wireframes defined by mineralised domains. Most modelling convention has the largest parent cell size possible used which is generally based on half the distance between holes of the dominant drill hole spacing in the X and Y dimensions. Cell dimensions are generally used in order to avoid overly small cells

that imply a level of refinement in the model that is not justified by the drill hole spacing. With the varied drill spacing across the South Atlantic Project deposits, there was a requirement to have a 'best fit' parent cell size. Based upon this, the parent cell size selected to best fit the drill hole data was 50m x 200m x 1m in the XYZ directions for the Retiro deposit. The model cell size for Bujuru deposit was selected as 50m x 100m x 1m in the XYZ directions and was based on the dominant drill spacing.

A model was generated for each deposit and interpolated using inverse distance weighting (with a power of 3) and the preliminary estimates were compared with drill hole grades. It was found that this cell size and parameters chosen were resulting in an acceptable interpolation process.

The search ellipse used for the grade interpolation was guided by the dynamic ellipsoid routine employed by Datamine. This allows for variations in mineralisation strike, dip and plunge to be accounted for during the grade interpolation.

The mineral assemblage composite identifiers were interpolated into the block model utilising a nearest neighbour method with the mineralogy results joined into the model following the primary grade validation.

Variography was carried out prior to interpolation as part of developing search ellipse directions and sizes. Resulting variograms were used to test the drill spacing (and continuity of THM grade) and these supported the final selected JORC Mineral Resource category.

Cut-off grades

A cut-off-grade of 1% THM was used to report Mineral Resource tonnes and grade from within the granted tenure for the South Atlantic Project. No other cutting or assumptions on minimum thickness were made when reporting the Mineral Resource estimate.

Classification criteria

The South Atlantic Project has been assigned a JORC Classification of Indicated and Inferred Resource which is supported by the following criteria:

- drill hole spacing (based on variography);
- continuity of geology, THM mineralisation and mineralogical identification; and
- distribution and weighting of mineral assemblage composites.

The density/number of samples and distribution of mineral assemblage composites is to an adequate level of density for the JORC Classification for both the Retiro and Bujuru deposits within the South Atlantic Project.

Mining and metallurgical methods and parameters

Based on the characteristics of the orebodies, along with environmental and economic factors, it is anticipated that some combination of dredges (1 or 2) would be used to mine the Retiro and Bujuru deposits. The water table is close to or at surface for most of the year and de-watering to facilitate dry mining is not considered to be economic or practical. Technical studies have been carried out by IHC Mining Advisory Services in the Netherlands to establish the likely dredging scenarios for the project.

Metallurgical testwork has been carried out by IHC Mining at their test facility in Queensland, Australia and this work has allowed for the development of process flowsheets for both deposits that deliver a mix of saleable product streams for the mineral sands market.

RGM Option Agreement

Sheffield entered into an option agreement with RGM in February 2023 with amendments and an extension period being agreed between the parties in August 2024. Sheffield has to date provided US$2.5m to fund RGM project related activities and maintains earn an option to acquire up to 80% of RGM via a staged investment approach, subject to various conditions and milestones being achieved (please refer to the ASX announcement dated 28 February 2023 for further information).

Sheffield will provide further updates to the market in respect of any material developments in connection with the RGM Option Agreement in due course.

ABOUT SHEFFIELD RESOURCES

Sheffield Resources Limited is focused on assembling a portfolio of global mineral sands development and production assets to generate cash returns and growth.

Our core asset is our 50% investment in Kimberley Mineral Sands Pty Ltd (KMS), the owner of the world class Thunderbird Mineral Sands Mine in operation in north-west Western Australia.

Additionally, Sheffield executed a binding agreement in February 2023, providing the Company with an option to acquire up to an initial 20% interest in the South Atlantic Mineral Sands Project in Brazil, and owns 10% of Capital Metals Plc (AIM: CMET), the owner of the Taprobane Mineral Sands Project in Sri Lanka.

KIMBERLEY MINERAL SANDS

Kimberley Mineral Sands Pty Ltd, (KMS) is a 50:50 Joint Venture between Sheffield and Yansteel. The joint venture owns and operates the Thunderbird Mineral Sands Mine and actively exploring adjacent tenements on the Dampier Peninsula.

KMS is governed by a four person Board of Directors with Sheffield and Yansteel each nominating two directors. Key Joint Venture decisions require unanimous approval of both shareholders. KMS operates as a standalone entity with its own management and employees.

THUNDERBIRD MINERAL SANDS MINE

The Thunderbird Mineral Sands Mine ("Thunderbird") is one of the largest and highest grade mineral sands discoveries in the last 30 years.

Now in production Thunderbird is expected to generate a high-quality suite of mineral sands concentrate products suited to market requirements. These products include a zircon concentrate and an ilmenite concentrate that contains a high quality ilmenite suitable smelting into chloride slag or for manufacturing titanium dioxide pigment.

Thunderbird is located in one of the world's most attractive mining investment jurisdictions and is well placed to deliver long term, secure supply of high quality products to a range of potential customers over a decades long mine life.

ABOUT YANSTEEL

Yansteel is a wholly-owned subsidiary of Tangshan Yanshan Iron & Steel Co., Ltd, a privately owned steel manufacturer headquartered in Hebei, China producing approximately 10mt per annum of steel products and has annual revenues of ~A$6bn.

Yansteel's 500ktpa integrated titanium dioxide processing facility, which includes a titanium slag smelter, will consume the magnetic concentrate from Stage 1 of the Thunderbird Mineral Sands Project under a take or pay offtake agreement.

SOUTH ATLANTIC PROJECT

The South Atlantic Project is located in south east Brazil. Four main deposits have been identified within the project area: Retiro, Estreito, Capao do Meio and Bujuru with Mineral Resources developed for the Retiro and Bujuru deposits. The combined Mineral Resource for Retiro and Bojuru is 771Mt of material at an average grade of 3.0% THM.

The tenements are held by RGM. Sheffield entered into an option agreement with RGM in February 2023 and extended it in August 2024. Sheffield will provide US$4.0m to fund project related activities over an initial 30 month period and earn an option to acquire up to 20% of RGM via the progressive investment of a further US$11.0m (US$15.0m in total) to acquire a 20% interest. Should Sheffield elect to exercise the option, subject to various conditions being satisfied, including project financing being obtained and all funds required for project construction being secured, Sheffield may exercise a further option to increase its interest in RGM up to 80%.

COMPETENT PERSONS AND COMPLIANCE STATEMENTS

The information in this announcement that relates to the Retiro and Bujuru Mineral Resources is based on information compiled under the guidance of Mr Greg Jones, a Competent Person who is a Fellow of the Australasian Institute of Mining and Metallurgy (AusIMM). Mr Jones is an employee of IHC Mining and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Jones consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

APPENDIX 1: JORC (2012) Table 1 Report

The table below summaries the assessment and reporting criteria used for the Retiro and Bujuru Mineral Resources and reflects the guidelines in Table 1 of The Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code, 2012).

Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• *All holes were drilled vertically* • *Drill holes were sampled at varying down hole interval lengths. The dominant down hole interval length is 1 m, complimented by 0.5 m intervals associated with older historic drilling and 3 m intervals.* • *Drilling was completed using a variation of drilling techniques, from historic manual percussion, semi manual percussion to reverse circulation and sonic drilling methods.* • *Samples were split on site at the RGM facilities before submission to primary laboratory Diamantina for the latest work.*
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• *All holes were drilled vertically* • *Drilling was completed using a variation of drilling techniques, from historic manual percussion, semi manual percussion to reverse circulation and sonic drilling methods.* • *Latest RC drilling used Core diameter is NQ (76 mm external diameter), with 3 metre rod lengths fitted with a face discharge drill bit* • *Sonic drilling utilised a 4inch OD core barrel using slow rotation and vibration*
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential*	• *Recent RC and sonic drill programs were supervised and operated by industry leading mineral sand drilling specialists with experienced drillers to maximise drill recovery such as maintaining drill penetration rates, airflow and water injection.* • *In particular, one of the predominant reasons behind the completion of the close spaced sonic*

Criteria	JORC Code explanation	Commentary
	loss/gain of fine/coarse material.	*drill program was to measure consistency of grade down hole against previously drilled RC drill holes and to successfully rule out any potential for down hole contamination associated with previous drill programs. This program was significant in that it provided confidence and assurance for the previous drilling completed prior to the 2022 sonic program.* • *There is no correlation between recovery and grade resulting in no sample bias*
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• *All samples were visually checked and logged on site by rig geologist and logged for lithotype, grain size, sorting, colour, competence, moisture content* • *Every drill hole was logged in full with detailed logging.* • *Logging is undertaken with reference to a drilling guideline with codes prescribed and guidance on description to ensure consistent and systematic data collection*
Sub-sampling techniques and sample preparation	• *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• *The material was split in the Company Bujuru sample storage facility and securely placed in a calico sample bag. The calico sample bags were sundried before being shipped.* • *For one sample in every 25, an additional calico bagged sample were taken for checking purposes.* • *Primary samples were submitted to Diamantina Laboratory, Perth, Australia. Secondary samples submitted to SGS, Brazil. The initial top metre of drill hole submitted to Intertec for analysis* • *All laboratories: separation of concentrates was by heavy liquid (tetrabromoethane (TBE) at density 2.95 g/cc)* • *All samples were:* o *Dried, weighed* o *Sample riffle split to produce 100 gram A sample* o *Sample screened +1 mm weighed* o *Sample screened -45 µm* o *weighed* o *TBE for heavy media separation* o *TBE Floats weighed* o *TBE Sinks weighed*
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• *Analytical procedure conforms to AS4350.2-1999; Australian Standards Heavy mineral sand concentrates - Physical testing using TBE.* • *Quality control procedures:* • *Regular checks of analyses* • *Submission of umpire samples to a second laboratory* • *Submission of randomly inserted control samples at a rate on approximately 1 in 25* • *Duplicate sample analyses*
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.*	• *All results are checked by the Competent Person* • *The Competent Person makes periodic visits to the laboratory to observe sample processing* • *A process of laboratory data validation using mass*

Criteria	JORC Code explanation	Commentary
	• *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	*balance is undertaken to identify entry errors or questionable data* • *QAQC samples but field and laboratory of each batch are plotted to identify potential quality control issues* • *Standard Certified Reference Material sample results are checked from each sample batch to ensure they are within tolerances (<2SD) and that there is no bias or drift* • *Data validation criteria are included to check for overlapping sample intervals, and other common errors* • *No adjustments are made to the primary assay data*
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• *Down hole surveys for shallow vertical drill holes are not required* • *Initial handheld GPS was used to identify the positions of the drill holes in the field and subsequently re-surveyed using a professional DGPS survey pickup for each collar position upon completion of program.* • *The datum used is SIRGAS 2000 ('Sistema de Referencia Geocentrico para las Americas 2000') replacing the SIRGAS 1995 system.*
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• *The early drilling completed in year 2000 (defined by hole ID naming convention 'RET') was completed using a dominant drill grid spacing of 100 m x 1,000 m (XY) along strike for the entirety of the Retiro deposit. Follow-up drilling in 2014 (defined by hole ID naming convention 'S14') was completed using a 100 m x 250 m (XY) in-fill drill program to target the central region of the Retiro deposit, considered to be of high prospectivity, whilst both the southern and northern extents were completed using a wider spaced grid pattern of 200 m x 500 m (XY) and 500 m x 500 m (XY) at the extreme extents.* • *The latest 2024 drilling predominantly consists of RC drilling (defined by hole ID naming convention 'RTAC') using a drill grid spacing of 200 m x 400 m (XY) to in-fill existing drilling along strike for the Central and northern extents of the Retiro deposit. The company completed a small focused closed spaced sonic drill program within the central area of the Retiro deposit using a 25 m spacing to be used to check close spaced grade variability and to check previous drilling down hole assays.* • *The Bujuru drill grid pattern consists of historic drilling (defined by hole ID naming convention 'PB') and the more recent 2024 RC in-fill drilling (defined by hole ID naming convention 'BJAC'). The historic drilling was completed at a relatively consistent drill grid spacing of 200 m x 1,000 m (XY) along strike in the deposits entirety.* • *Th historic drilling has subsequently been in-filled during RGM 2024 drill campaign utilising a dominant drill grid spacing 200 m x 400 m (XY) pattern. The latest drilling does exhibit some larger breaks between drill lines along strike between 1,200 m and 2,500 m as RGM used this opportunity to in-fill regions of the deposit considered as high prospectivity based on THM*

Criteria	JORC Code explanation	Commentary
		grade observed in the earlier drilling.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• *All drill holes were drilled vertically* • *Drill line were drilled northeast - southwest, southeast – northwest along strike which is perpendicular to the current active shoreline.* • *No bias to drill grid sampling has been introduced*
Sample security	• *The measures taken to ensure sample security.*	• *All samples were submitted to the Company's Bujuru sample storage facility at the end of each day, both the sample bags and sample chip trays.* • *Sample bags were labelled by marker on the outside and an aluminium tag was placed inside each sample bag. Each sample was also securely zip tied with an additional plastic sample tag attached.* • *Samples were split and dried at the Bujuru sample storage facility.* • *Samples were securely shipped by air freight and sea freight to Diamantina, Perth, Australia. Secondary samples were dispatched to Intertec and SGS, Brazil by road freight.* • *Samples were placed in calico bags and grouped in rice bags by drill hole*

Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• *Audits and reviews or the sampling data and techniques have been carried out by:*
		  ○ *RPA (2013)*
		  ○ *IHC Mining (2021)*
		• *Some items were identified with the historical drilling to be rectified in future drill programs.*
		• *The 2014 drilling program did twin some of the older historical holes and subsequent database reviews did identify some bias between the two drilling sets below 6 m depth. For this reason, only the top 6m were utilised in the preparation of the Exploration Targets.*

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• *The South Atlantic HMS project is 100% owned by RGM and is located wholly within exploration tenure wholly owned and managed by RGM.* • *The Company tenure are outlined in the body of the report in Section 3.4.*

Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• *Drilling has been carried out in the past by:*
		  ○ *RTZ and Paranapanema SA, 471 holes for Retiro and 286 holes for Bujuru (prior to 2014)*
		  ○ *Sibelco 182 holes (2014)*

Criteria	JORC Code explanation	Commentary
Geology	• *Deposit type, geological setting and style of mineralisation.*	• *The Rio Grande do Sul Coastal Plain is also known for its extensive sand dunes, which have formed by the action of wind and sea currents and influenced by changing sea levels due to glaciation events.* • *The more recent sedimentation has included the transport, concentration and preservation of HM placers along the barrier beach shorelines of the project area* • *There are four main types of sedimentary units that have been identified within the project area (After TZMI 2013):* o *Beige, well-sorted eolian sands that are primarily found on beach sands and dune fields and are typically low grade (1%, rarely 2-3%).* o *Fine-grained, beige sea sands that can contain up to 10% THM and are often of a fine texture. Additionally, lenses of fine clayey sands, layers of peat intercalations, and discontinuous layers rich in shells can all be found in these sands (10 - 15 cm thick).* o *Sands that range from beige to greenish-beige and contain a lot of clayey to plastic clay sands. Low levels of THM are also seen in this unit.* o *Clayey sand that can range in colour from greyish beige to black and contains up to 3.5% THM in some locations. These sediments often occur in discontinuous deposits and include clay lens intercalations.*
Drillhole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:* • easting and northing of the drillhole collar • elevation or RL (elevation above sea level in metres) of the drillhole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• *A summary of the drill holes used in the development of the Exploration Targets is presented in Appendix 2 and 3. All composites are reported without any cut-off grade and are a composite of vertical and unbroken domain used to control the grade interpolation used to populate the block model.*
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated*	• *All length weighted intervals are reported for each hole for grades above 1% THM.* • *For the Mineral Resource estimate reporting, the cut-off grade for reporting was THM>1%.*

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	• *If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').*	• *All drill holes are vertical and perpendicular to the dip and strike of mineralisation and therefore all interceptions are approximately true thickness.* • *Drill holes are inferred to intersect the mineralisation approximately perpendicularly. The deposit style is flat-lying and therefore the vertical holes are assumed to intersect the true width of any mineralisation.*
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• *Figures and plans are displayed in the main text of this release.*
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• *All drill results >1% THM have been summarised as composited intervals and reported and tabulated in Appendix 2*
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• *Samples have not yet been tested for in situ density.* • *Detailed mineral assemblage work has been undertaken on composite samples from across the South Atlantic Project, for both the Retiro and Bujuru deposits.* • *Sample composites were submitted to IHC Mining laboratory for a bespoke mineral assemblage analysis.* • *This method utilises magnetic separation and XRF on the various magnetic, paramagnetic and non-magnetic fractions to calculate mineral species such as ilmenite, rutile and zircon.* • *These mineral assemblages are then validated with a regression analysis using QEMSCAN.*
Further work	• *The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).*	• *Further infill drilling to support increases in JORC Mineral Resource confidence* • *Project development pit optimisation and dredging studies.*

Section 3: Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• *Original laboratory files were used to populate exploration database assay tables via an automatic software assay importer where available.* • *Checks of data by visually inspecting on screen (to identify translation of samples), duplicate and twin drilling was visually examined to check the reproducibility of assays.* • *Database assay values have been subjected to random reconciliation with laboratory certified value is to ensure agreement.* • *Visual and statistical comparison was undertaken to check the validity of results.*

Criteria	JORC Code explanation	Commentary
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• *A site trip was undertaken by Greg Jones in February 2024 to review drilling, sampling and sample preparation.* • *Company geologists were on site during this visit and observation was made of the siting of drill rigs with respect to surveyed collars, panning and logging and collection of samples, maintaining the*
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• *The geomorphology of the South Atlantic HMS project is controlled by the active shoreline which is dominated by sandy beaches and dunal systems host to the near surface, mineralised, fine grained, quartzose sands forming a Holocene aged barrier-lagoon system. The mineralisation of the South Atlantic deposit is relatively straight forward whereby the high grade, low slimes material is from surface, typically 2 m to 6 m thick and is laterally continuous, following the general morphology of the natural form of the undulating beach/dunal systems. There are regions of the project which exhibit an uplift in THM grade highlighting specific areas of high prospectivity.*
Dimensions	*The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• *The dimensions of the Retiro deposit is approximately 31 km in length along strike. The across strike dimension varies typically between 1.2 km and 2.2 km.* • *The dimensions for the Bujuru deposit is approximately 31 km in length and between 2.2 km and 4.3 km across strike.* • *Thickness of mineralisation varies typically between a few metres to up to 10 metres thick across both deposits.*
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.*	• *CAE mining software Datamine Studio RM was used to estimate the mineral resources* • *Inverse distance weighting techniques were used to interpolate assay grades from drill hole samples into the block model and nearest neighbour techniques were used to interpolate index values and non-numeric sample identification into the block model* • *The mostly regular dimensions of the drill grid and the anisotropy of the drilling and sampling grid allowed for the use of inverse distance methodologies as no de-clustering of samples was required* • *Appropriate and industry standard search ellipses were used to search for data for the interpolation and suitable limitations on the number of samples and the impact of those samples was maintained. An inverse distance weighting of three was used so as not to over smooth the grade interpolations* • *Hard domain boundaries were used and these were defined by the geological wireframes that were interpreted* • *Topographic surface was created from LIDAR data.* • *Resource was modelled to key geological boundaries and then reported at cut-off grades of 1 THM%.* • *The average parent cell size used for the interpolation was approximately half the standard drill hole width and a half of the standard drill hole section line spacing.* • *The average drill hole spacing for the two deposits*

Criteria	JORC Code explanation	Commentary
	• *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	*was 100 m east-west and 200 m north-south and with a 1.5 m samples and so the selected parent cell size was 50 x 100 x 1.5 m (where the Z or vertical direction of the cell was nominated as the same distance as the sample length).* • *An unpublished Mineral Resource estimate had been undertaken previously 2013, GNJ Consulting* • *Prior to this current phase of work an Exploration Target was declared for the Retiro and Bujuru deposits* • *No assumptions have been made regarding recovery of by-products* • *No deleterious elements or non-grade variables are present* • *All resource block are mined from the surface with no overburden* • *Mineral assemblages show little statistical variation over the deposit, and correlate well with HM content.* • *Grade cutting or capping was not used during the interpolation because of the regular nature of sample spacing.* • *Sample distributions were reviewed and no extreme outliers were identified either high or low that necessitated any grade cutting or capping.* • *Validation of grade interpolations were done visually In CAE Studio (Datamine) software by loading model and drill hole files and annotating and colouring and using filtering to check for the appropriateness of interpolations* • *Statistical distributions were prepared for model zones from drill hole and model files to compare the effectiveness of the interpolation* • *Along strike distributions of section line averages (swath plots) for drill holes and models were also prepared for comparison purposes*
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• *Tonnages were estimated an assumed dry basis* • *The bulk density used for the South Atlantic HMS project is based on a simple linear algorithm originally developed by John Baxter (1977). IHC Mining from experience of working with these styles of ore bodies considers that this algorithm is a fair approximation of the in situ dry bulk density at this stage of the project*
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• *Cut-off grades were used for reporting the Mineral Resource estimate. No top or bottom cuts were used for grade interpolation*
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• *Mining method is assumed to be wet, utilising dredge based extraction. The deposits are planned to be mined from surface with no minimum dimensions laterally, but with a minimum of 2.5m of depth for the dredging pond.*

Criteria	JORC Code explanation	Commentary
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• *Metallurgical assumptions were used based on mineral assemblage composites and metallurgical testwork carried out on larger representative bulks samples which were processed at the IHC Mining Queensland metallurgical test facility.*
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• *No assumptions have been made regarding possible waste and process residue however disposal of products such as SLIMES, sand and oversize are normally part of capture and disposal back into the mining void for eventual rehabilitation upon completion of the dredge mining corridor.* • *Water management is very important for the project area and the proposed mining method of dredging will have the most minimalistic impact on the water table.*
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• *The bulk density used for the South Atlantic HMS project is based on a simple value which approximates the bulk density of quartz sand, which is 1.6 gcm^{-3} using a standard packing factor.* • *IHC Mining from experience of working with these styles of ore bodies considers that this algorithm is a fair approximation of the in situ dry bulk density*
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• *The resource classification for the South Atlantic HMS project Retiro and Bujuru deposits were based on the following criteria: drill hole spacing and the distribution and influence of mineral assemblage composites* • *The classification of the Indicated, and Inferred Mineral Resources was supported by the uncomplicated geology, continuity of mineralisation, confidence in the drill hole data and all of the supporting criteria as noted above* • *As a Competent Person, IHC Mining Geological Services Manager Greg Jones considers that the result appropriately reflects a reasonable view of the deposit categorisation*
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• *No audit or review undertaken at this stage of the project.*
Discussion of relative	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the*	• *No statistical or geo-statistical review of the accuracy of the resource estimate has been undertaken* • *Variography was undertaken to determine the drill*

Criteria	JORC Code explanation	Commentary
accuracy/ confidence	*Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	*hole support of the selected JORC classification* • *Validation of the model vs drill hole grades by direct observation and comparison of the results on screen, swathe plot and population distribution analysis was favourable* • *The resource statement is a global estimate for the entire known extent of the South Atlantic HMS project defined for each the Retiro and Bujuru deposits within the Exploration Permit* • *There has been no production to date*

APPENDIX 2: DRILL HOLE COMPOSITE INFORMATION – RETIRO DEPOSIT

HOLE ID	EASTING	NORTHING	RL	FROM	TO	LENGTH	ZONE	THM%
RET101	400585	6461313	-1.7	4	5	1	1	2.8
RET102	400670	6461132	0.9	2	6	4	1	2.2
