

## Momentum at Main Lode continues with more drilling success

- **First deep RC drillhole testing depth potential successfully intersects plunging gold structure.**
- **Result validates existing geological interpretation and confirms continuity of host shear and depth potential of the mine; mineralised system remains open**
- **Further drilling planned to continue testing upper levels and strike potential of the Main Lode system**

Barra Resources Limited ('Barra' or the 'Company') is pleased to announce the results of its recent reverse circulation (RC) drill hole program at the historic Main Lode Gold Mine (Main Lode) at its Burbanks Project, located 9km south of Coolgardie, Western Australia.

The Company recently completed its first deep RC hole (BBRC256) aimed to test a target area below the historical mined high-grade zone on Level 6. The target area was based on an interpretation of the historic Main Lode long section which suggested high-grade lodes in the northern section of the mine have a moderate north plunging orientation, and that these lodes may extend at depth (Figure1).

This was successfully achieved with hole BBRC256 intersecting 3.0m @ 1.08g/t Au within the target area, down-plunge of previous mining activity on Level 6, confirming both the continuation of the host shear and that it remains mineralised and open at depth (Figure 2).

Importantly, the mineral assemblage of quartz + carbonate + chlorite + pyrite observed in BBRC256 is indicative of the lower-grade halo proximal to high-grade mineralisation. This alteration halo assemblage was observed in the recent RC drilling program in February which intersected multiple high-grade lodes within the same host shear (*refer: ASX Release dated 14<sup>th</sup> March 2017*).

The result of this drill hole is significant as it has increased Barra's knowledge of the Main Lode system, serving to improve our exploration strategy for targeting new high-grade lodes in the future.

The Company's knowledge and confidence in Main Lode continues to improve with every stage of exploration. Drilling programs are currently being planned to follow up depth extensions immediately below our recent successful RC program in February, and to test along strike to the north between Main Lode and Trumpeter.

ENDS

A handwritten signature in black ink, appearing to read 'G. Berrell'.

**Gary Berrell**  
Chairman & CEO  
Barra Resources Limited

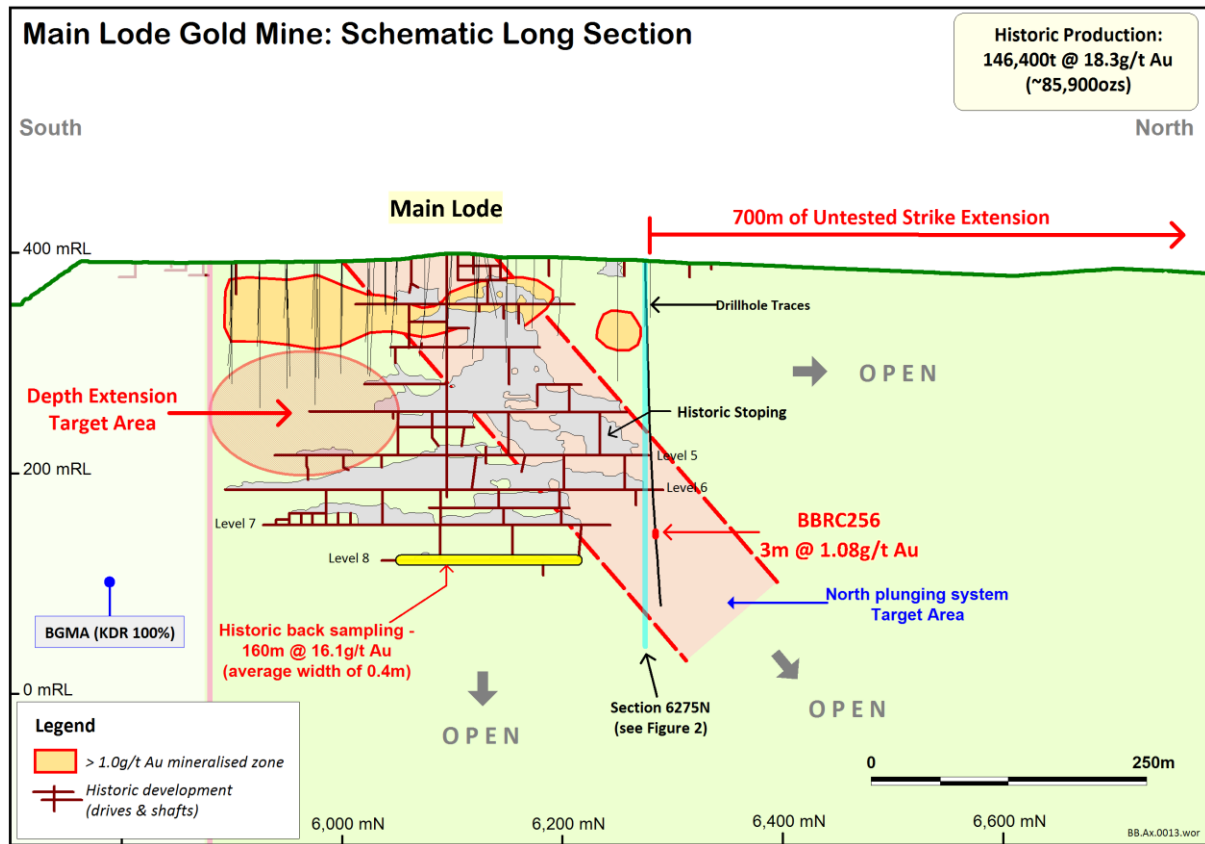

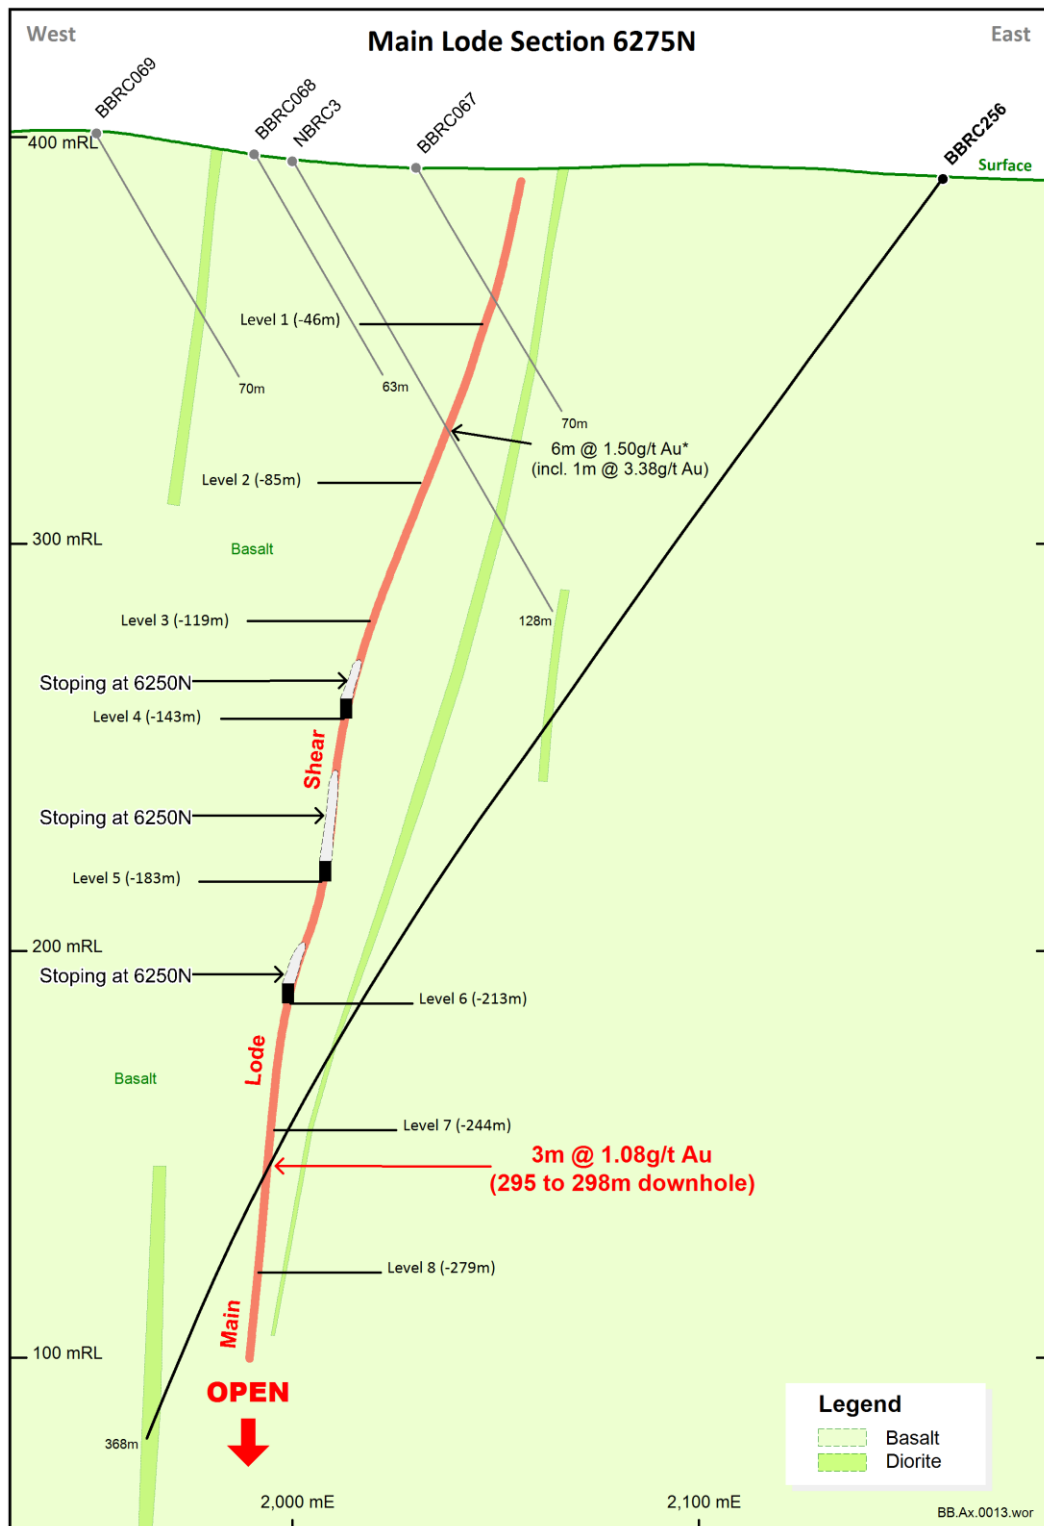

Figure 1: Main Lode schematic long section showing BBRC256 intersection pierce point within the interpreted north-plunging target area.

**Figure 2: Main Node schematic section 6275N showing BBRC256 intersecting the Main Node shear below historic stoping on Level 6.**

\* Intersection is historic in nature and previously reported in the following ASX Release which can be viewed at [www.barraresources.com.au](http://www.barraresources.com.au); 28/08/2008 Burbanks Mainnode RC Update.

The Company is not aware of any new information or data that materially affects the information included in the relevant market announcements and that all material assumptions and parameters used in the relevant market announcements continue to apply and have not materially changed.

## **Main Lode Gold Mine - Background**

The Main Lode Gold Mine lies within Barra's exclusive Reservation Area within mining lease M15/161, (held by Kidman Resources Limited (KDR) (see Diagram 1)), and is being targeted by the Company with the aim of establishing a significant resource base that can be developed to provide ongoing and sustainable cashflow at Burbanks.

Between 1885 and 1914, the Main Lode Gold Mine produced 146,000t @ 18.3g/t gold for approximately 85,900oz of gold. The Burbanks Mining Centre, which includes the Main Lode Gold Mine and the neighbouring Birthday Gift Gold Mine, 900 metres to the south, was one the richest gold mining areas in the Eastern Goldfields of Western Australia until the onset of World War 1.

At Main Lode, underground mining stopped at Level 7, a vertical depth of 240m below surface level (b.s.l). Level 8, at 275m b.s.l, was developed but not mined. Between 1946 and 1951, WMC accessed Level 8 and undertook extensive channel sampling of the backs yielding a pay-run of 160m grading 16.1g/t gold at an average width of 0.4m (Figure 2).

The Burbanks Project has a proven production history with more than 400,000 ounces produced from Birthday Gift and Main Lode mines since 1885. Barra has held an interest in the project area since 1999 where it has produced 36,000 ounces in its own capacity and via tribute mining agreements with third parties. Barra sees the Burbanks Project area, specifically the Main Lode Gold Mine as having excellent potential to host larger high-grade lodes at depth.

The high-grade gold system that host the Main Lode and Birthday Gift Gold Mines is controlled by the Burbanks Shear Zone. The shear zone is host to numerous gold prospects including Burbanks North located just 900 metres along strike to the north of the Main Lode Gold Mine.

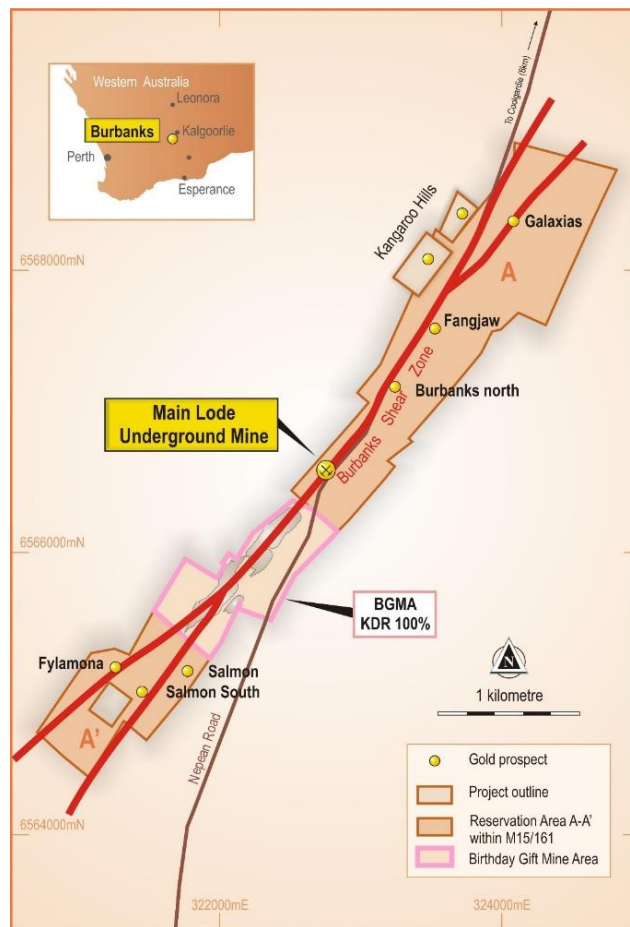

## **Competent Persons Statement**

The information in this report which relates to Exploration Results is based on information compiled by Gary Harvey who is a Member of the Australian Institute of Geoscientists and a full-time employee of Barra Resources Ltd. Gary Harvey has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Gary Harvey consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

## **Disclaimer**

The interpretations and conclusions reached in this report are based on current geological theory and the best evidence available to the authors at the time of writing. It is the nature of all scientific conclusions that they are founded on an assessment of probabilities and, however high these probabilities might be, they make no claim for complete certainty. Any economic decisions that might be taken on the basis of interpretations or conclusions contained in this report will therefore carry an element of risk.

It should not be assumed that the reported Exploration Results will result, with further exploration, in the definition of a Mineral Resource.

**Diagram 1: Burbanks Project showing location of the Main Lode Gold Mine and separation of rights to Mining Lease M15/161. Barra has 100% rights to explore and mine on area A-A' (Reservation Area).**

THE FOLLOWING TABLES ARE PROVIDED TO ENSURE COMPLIANCE WITH THE JORC CODE (2012 EDITION) FOR THE REPORTING OF EXPLORATION RESULTS.

TABLE 1

Summary of Main Lode RC drilling intersections with an average gold grade greater than or equal to 1.0 gram per tonne.

HoleID	Northing	Easting	Elevation	Dip	Azimuth	Total Depth	From	To	Width	Au (g/t)
BBRC256	6275	2160	390	-55	270	368	295	298	3	1.08
							295	296	1	1.24
							296	297	1	0.31

## MAIN LODE PROSPECT

### SECTION 1 – SAMPLING TECHNIQUES AND DATA

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<ul style="list-style-type: none"> <li>For RC drilling, a 1m split samples is collected directly from a Sandvik Rotaport (rotating) cone splitter mounted directly below the rigs cyclone. The cyclone and splitter are cleaned regularly to minimize contamination.</li> </ul>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<ul style="list-style-type: none"> <li>Sample and QAQC procedures are carried out using Barra's protocols and in line with industry best practice</li> </ul>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information</li> </ul>	<ul style="list-style-type: none"> <li>For RC drilling, 1m samples are obtained from which a 3kg split Sample is collected. Through mineralised zones (as determined by the geologist in charge) Split Samples are collected for analysis. Through non-mineralised zones a 3kg composite (up to 4m) Sample is collected using an alloy scoop for analysis.</li> <li>Samples are dried, pulverised and further split to produce a 40g sub-sample which is analysed by fire assay with an AAS finish.</li> <li>Samples were only assayed for gold.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</li> </ul>	<ul style="list-style-type: none"> <li>Reverse circulation (RC) drilling was carried out using a face sampling hammer with nominal 146mm diameter (5.75") drill bit.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	<ul style="list-style-type: none"> <li>RC sample recoveries are visually estimated qualitatively on a metre basis and recorded in the database.</li> </ul>
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	<ul style="list-style-type: none"> <li>Drilling contractors adjust their drilling approach to specific conditions to maximise sample</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>recovery.</p> <ul style="list-style-type: none"> <li>• Drill cyclone and splitter are cleaned between rod changes and after each hole to minimise downhole and cross-hole contamination.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>• No sample recovery issues have impacted on potential sample bias.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>• <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All drillholes are logged in full and to a level of detail that would support an appropriate Mineral Resource and mining study.</li> <li>• RC holes were logged at 1m intervals for the entire hole from drill chips collected and stored in chip trays. Data was recorded for regolith, lithology, veining, fabric (structure), grain size, colour, sulphide presence, alteration and oxidation state.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Logging is both qualitative and quantitative in nature depending on the field being logged.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All drillholes are logged in full.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>• <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> </ul>	<ul style="list-style-type: none"> <li>• n/a</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All RC samples were passed through cyclone and rotating cone splitter and a ~3kg split Sample is collected for each 1m interval.</li> <li>• 1m split Samples were collected for analysis from selected zones based on field logging. All other zones were sampled by collecting a composite sample (up to 4m).</li> <li>• Samples are collected both wet and dry.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Sample preparation was conducted at Bureau Veritas' Kalassay Laboratory in Perth using a fully automated sample preparation system. Preparation commences with sorting and drying. Oversized samples are crushed to &lt;3mm and split down to 3kg using a rotary or riffle splitter. Samples are then pulverized and homogenized in LM5 Ring Mills and ground to ensure &gt;90% passes 75µm.</li> <li>• 200g of pulverized sample is taken by spatula and used for a 40g charge for Fire Assay for gold analysis. A high-capacity vacuum cleaning system is used to clean sample preparation equipment between each sample.</li> <li>• The sample size is considered appropriate for this type and style of mineralisation.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> </ul>	<ul style="list-style-type: none"> <li>• QC procedures include the submission of Certified Reference Material (CRM's), blanks and duplicate samples with each batch of samples. Selected samples are also re-assayed to confirm anomalous results.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Field duplicate samples were collected at a rate of 1 every 25m per hole.</li> </ul>
	<ul style="list-style-type: none"> <li>• <i>Whether sample sizes are appropriate to the grain</i></li> </ul>	<ul style="list-style-type: none"> <li>• Sample size is considered appropriate for gold</li> </ul>

Criteria	JORC Code explanation	Commentary
	<i>size of the material being sampled.</i>	exploration.
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	<ul style="list-style-type: none"> <li>Fire Assay is an industry standard analysis technique for determining the total gold content of a sample. The 40g charge is mixed with a lead based flux. The charge/flux mixture is 'fired' at 1100°C for 50mins fusing the sample. The gold is extracted from the fused sample using Nitric (HNO<sub>3</sub>) and Hydrochloric (HCl) acids. The acid solution is then subjected to Atomic Absorption Spectrometry (AAS) to determine gold content. The detection level for the Fire Assay/AAS technique is 0.01ppm.</li> </ul>
	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> </ul>	<ul style="list-style-type: none"> <li>n/a</li> </ul>
	<ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Laboratory QA/QC controls during the analysis process include duplicates for reproducibility, blank samples for contamination and standards for bias.</li> </ul>
