

## Pure Minerals Limited

14 September 2017

### ASX Announcement

#### KEY BATTERY HUB TENEMENT GRANTED

- Key 100%-owned exploration license granted within the Battery Hub manganese project, Western Australia.
- Pure Minerals now holds multiple manganese prospects over more than 30 km strike length.
- Tenement with additional ~20 km strike length expected to be granted in October 2017
- Drill program to be initiated immediately once required approvals achieved
- Company is well-funded following completion of \$4.5 million capital raising

Pure Minerals Limited (ASX: PM1) ("Pure Minerals", "the Company") is pleased to announce it has been granted the key 100%-owned exploration license covering more than 30km of known manganese mineralization within the Battery Hub project (Figure 1, below).

Now that E09/2217 is granted, Battery Hub will be a priority area for Pure Minerals due to its large size and prospectivity. More than 40 manganese prospects have been reported to occur along the entire strike length of the host formation, many with surface samples exceeding 50% Mn. Historic drilling has intersected grades exceeding 40% Mn.

The other tenement at Battery Hub, E52/3523, is expected to be granted in October/November.

Pure Minerals will now fast-track approvals for a reverse circulation drilling program at the property with the objective of defining a maiden JORC resource. A surface mapping and sampling program and a historic drilling database of more than 500 holes will be used to design the most efficient drill program at Battery Hub.

Following the recent \$4.5 million capital raising, Pure Minerals is very well funded to aggressively pursue its exploration plans at Battery Hub and its other projects in the Gascoyne and Pilbara regions of Western Australia.
