

High grade exploration results underpin regional potential at Browns Range Heavy Rare Earth Project

Highlights

- High-grade rock chip samples of up to 7.19% TREO returned from regional sampling;
- Sampling returned multiple samples grading >1% TREO;
- RAB/RC drilling planned to provide first pass testing in Q2;
- RC program planned for Q3 for resource infill and step-out drilling;
- A\$2.15m private Placement completed to accelerate exploration, and
- SPP to close on 31 January 2018 to fund various initiatives including exploration

Australian heavy rare earths developer, Northern Minerals Limited (ASX: NTU) (the Company) is pleased to announce high grade rare earth oxide (REO) geochemical results from the Browns Range Project.

A total of 8 rock chip samples were collected in December 2017 from 7 prospect areas. Some of the samples were collected from known prospects, while others were from new target areas.

The highlights of the geochemical results are shown below, and the location of all samples is shown on Figure 1.

Sample	East	North	TREO%	Dy ₂ O ₃ ppm	Tb ₄ O ₇ ppm	HREO%
BRRK395	490773	7901771	7.19	6,247	918	91
BRRK394	494234	7902515	2.19	783	155	38
BRRK399	492002	7904642	1.15	1,015	132	96
BRRK397	490522	7910371	0.87	781	90	97
BRRK396	493433	7902579	0.83	690	94	84
BRRK398	492076	7904756	0.74	697	92	99
BRRK393	494933	7908449	0.22	187	27	87
BRRK392	494306	7903000	0.20	164	28	76

 $\textbf{TREO} = \textbf{Total Rare Earth Oxides} - La_2O_3, \ CeO_2, \ Pr_6O_{11}, \ Nd_2O_3, \ Sm_2O_3, \ Eu_2O_3, \ Gd_2O_3, \ Tb_4O_7, \ Dy_2O_3, \ Ho_2O_3, \ Er_2O_3, \ Tm_2O_3, \ Yb_2O_3, \ Lu_2O_3, \ Y_2O_3;$

HREO% = Heavy Rare Earth Oxides – Total of Sm_2O_3 , Eu_2O_3 , Gd_2O_3 , Tb_4O_7 , Dy_2O_3 , Ho_2O_3 , Er_2O_3 , Tm_2O_3 , Yb_2O_3 , Er_2O_3 and Y_2O_3 as a percentage of TREO

The results are significant, given the average grade of the Browns Range deposits is 0.66% TREO. The high proportion of Heavy Rare Earths for nearly all of the samples indicates that the rare earth mineral is likely to be xenotime, the same as that at Gambit West and Wolverine, the Company's first two open pit mines. Of particular note is the very high-grade sample (7.19% TREO) at Iceman, a prospect with a strong geochemical surface anomaly over 200m in length, which is yet to be drill tested (see Figure 2). The samples are point samples and therefore have a high potential of bias, and should not be considered as being representative of the overall mineralised structure or rock type. The samples were selected using a spectrometer and a portable XRF (measuring yttrium).

A program of RAB and/or RC drilling will commence in the June quarter, aimed at providing a first pass assessment of several of the new prospects and targets. If successful, a program of RC drilling will be undertaken in the September quarter aimed at proving up and increasing the Mineral Resources at Browns Range.

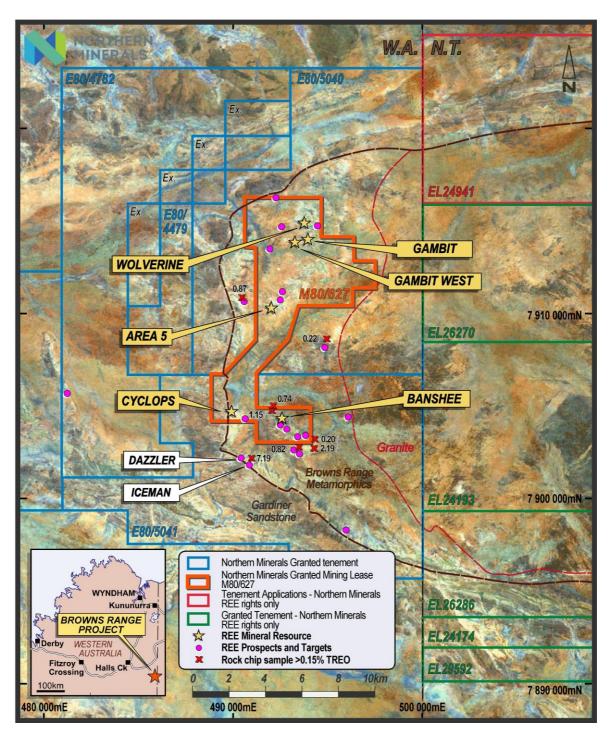

Figure 1 – Browns Range Project – Location of rock chip samples

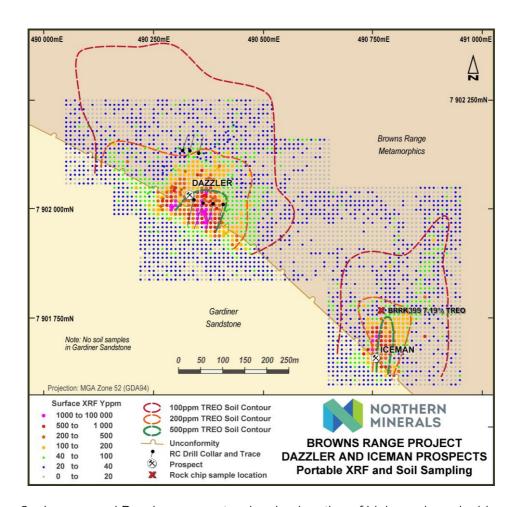

Figure 2 – Iceman and Dazzler prospects, showing location of high-grade rock chip sample

Placement

The Company is also pleased to announce a private Placement to sophisticated investors, raising \$2.15 million via the issue of 27,564,102 shares at 7.8¢ per share.

The final \$1m from the placement announced on the 28th of December 2017 will be received in the coming few days.

The Placement follows strong interest from several parties after the announcement of the project enhancement initiatives for the Browns Range HRE Project, including downstream processing and increased exploration.

The Placement has been made under ASX Listing Rule 7.1A.

SPP to close on 31 January

A reminder that the Northern Minerals Share Purchase Plan is closing on the 31st of January 2018 and eligible shareholders can click on the following link to request their personal application form:

http://www.northernmineralsspp.com.au/INVESTMENT/NorthernMinerals.aspx

Bonus Listed Options

The company is currently working on a prospectus expected to be lodged with the regulators in February to offer shareholders, 1 bonus listed option for every 5 shares held, with an exercise price of \$0.12 and expiry date of 31 December 2019.

Commentary

Northern Minerals' Managing Director and CEO, George Bauk, commented "These exploration results, although early stage, highlight the significant blue sky upside potential that exists at Browns Range.

"With a plan in place to extend the life of the potential full-scale project to more than 20 years, the new funds received from the Placement and the SPP allow us to accelerate the program and get drill rigs back on the ground in the June quarter.

Electric Vehicles – Not just a lithium story!

About Northern Minerals:

Northern Minerals Limited (ASX: NTU; Northern Minerals or the Company) has commenced development of the Browns Range Heavy Rare Earth Pilot Plant Project in northern Western Australia.

Through the development of its flagship project, the Browns Range Project (the Project), Northern Minerals aims to be the first significant world producer of dysprosium outside of China.

The Project is 100% owned by Northern Minerals and has several deposits and prospects containing high value dysprosium and other HREs, hosted in xenotime mineralisation.

Dysprosium is an essential ingredient in the production of DyNdFeB (dysprosium neodymium iron-boron) magnets used in clean energy and high technology solutions.

The three-year R&D pilot plant project will commence first production of heavy rare earth carbonate in H1 2018. The pilot plant development provides the opportunity to gain production experience, surety of supply for our offtake partner and assess the economic and technical feasibility of the larger full-scale development.

Compliance Statement

The information in this report relating to Exploration Results was compiled by Mr Robin Wilson who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Wilson is a full time employee of Northern Minerals Limited and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Wilson consents to the inclusion of this information in the form and context in which it appears.

24 January 2018

Table 1: JORC code, 2012 Edition

Section 1 - Sampling Techniques and Data

Criteria	JORC Code Explanation	Commentary
	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	Rock chip samples were taken from in-situ mineralisation using a hand held geo-pick. Typically, samples are in excess of 1kg. The sampling targeted breccias and veins with potential mineralisation, and were selected using a spectrometer and portable XRF measuring yttrium.
Sampling techniques	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Rock chip samples were taken for an indication of mineralisation only. As point samples they have a high potential of bias and should not be considered as being representative of the overall mineralised structure. Sample points were surveyed using a hand-held GPS. Number of samples collected:8
	Aspects of the determination of mineralisation that are Material to the Public Report.	Rock chip samples were taken for an indication of mineralisation only. As point samples they have a high potential of bias and should not be considered as being representative of the overall mineralised structure. The whole sample collected was crushed and pulverised prior to analysis.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Not applicable – no drilling completed
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Not applicable – no drilling completed
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Not applicable – no drilling completed

	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Not applicable – no drilling completed
	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Not applicable – no drilling completed
Logging	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	Not applicable – no drilling completed
	The total length and percentage of the relevant intersections logged.	Not applicable – no drilling completed
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	Not applicable – no drilling completed
Sub-sampling techniques and sample preparation	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	The sample preparation procedure follows industry best practice. Samples are oven dried at 120° C for 8 hours before processing through a Boyd jaw crusher reducing the sample to 90% passing 3mm. The samples are then pulverised to achieve a grind size of 85% passing 75 micron.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	No field subsampling.
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	No duplicate sampling nor analytical checks were performed for any sampling except the laboratory originated standards and repeats for internal QAQC purposed for geochemical analysis.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	Sample sizes of greater than 1kg are considered to be appropriate (based on previous sampling at Browns Range)
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Samples assayed by Genalysis-Perth for rare earth elements were fused with sodium peroxide within a nickel crucible and dissolved with hydrochloric acid for analysis. Fusion digestion ensures complete dissolution of the refractory minerals such as xenotime, which are only partially dissolved if the pulp is digested in acids. The digestion solution, suitably diluted, is analysed by ICP Mass Spectroscopy (ICP-MS), for the determination of the REE (La-Lu) plus Y, Th, Ba, Sr, Zr, and U. Al, Fe, Ti, Mg, P, Sc, and S,

		when analysed, use Inductively Coupled Plasma Optical Emission Spectroscopy (ICP-OES). The composition of the flux and crucible precludes the analysis of Na, Ni, Co, Cr and Mo, so these elements are not determined. These elements when requested use a four acid digest with ICP-OES finish, and this method is also used for K, Mn, V, As, Cu, Pb and Zn when analysed.
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	Northern Minerals has three Niton XRF XLt3-950 GOLDD+ portable XRF analysers (pXRF) which are used in the field. The read time is 30 seconds in "soil mode". Results are considered "fit for purpose" in the context of 'first-pass' measurements. Calibration is at least daily. PXRF readings of Yttrium are used to select the rock chip sample locations.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Laboratory QAQC involves the use of internal lab standards using certified reference material, blanks, splits and replicates as part of the in house procedures.
	The verification of significant intersections by either independent or alternative company personnel.	Internal verification of significant results by more than one company geologist.
	The use of twinned holes.	Not Applicable – no drilling completed
Varification of	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Handwritten data collected in the field was transferred into an excel template and verified by the field geologist. Location data from the GPS unit was downloaded and cross referenced against the data entry to ensure no transcription errors.
Verification of sampling and assaying		All data was checked by the responsible geologist and digitally transferred to Perth. Datashed is used as the database storage and management software and incorporates numerous data validation and integrity checks using a series of defined data loading tools. Data is stored on a SQL server and electronic backups completed three times per day.
	Discuss any adjustment to assay data.	Adjustments made to the assay data were limited to the conversion of reported elemental assays for a range of elements to the equivalent oxide compound as applicable to rare earth oxides. In all instances the original elemental data has been stored in the database and the equivalent oxide values loaded into appropriately labelled fields identifying them as calculated values. Selected checks on these calculated fields did not

		identify any issues.
		The oxides were calculated from the element according to the following factors below:
		$ \begin{array}{l} \text{CeO}_2 - 1.2284, Dy_2O_3 - 1.1477, Er_2O_3 - 1.1435, Eu_2O_3 - 1.1579, Gd_2O_3 - 1.1526, Ho_2O_3 - 1.1455, La_2O_3 - 1.1728, Lu_2O_3 - 1.1371, Nd_2O_3 - 1.1664, Pr_6O_{11} - 1.2082, Sm_2O_3 - 1.1596, Tb_4O_7 - 1.1421, Tm_2O_3 - 1.1421, Y_2O_3 - 1.2699, Yb_2O_3 - 1.1387 \end{array} $
		Ratios of each oxide to Total Rare Earth Oxides (TREO) are used to determine the percentages of heavy (HRE) and light (LRE) rare earth oxides. The criteria is summarised as:
		Rare earth oxide is the industry accepted form for reporting rare earths. The TREO (Total Rare Earth Oxide) is calculated from addition of La ₂ O ₃ , CeO ₂ , Pr ₆ O ₁₁ , Nd ₂ O ₃ , Sm ₂ O ₃ , Eu ₂ O ₃ , Gd ₂ O ₃ , Tb ₄ O ₇ , Dy ₂ O ₃ , Ho ₂ O ₃ , Er ₂ O ₃ , Tm ₂ O ₃ , Yb ₂ O ₃ , Y ₂ O ₃ , and Lu ₂ O ₃ . Note that Y ₂ O ₃ is included in the TREO calculation.
		Northern Minerals reports HREO% determined by the formula:
		$\begin{aligned} \textbf{HREO\%} &= \left[\text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3, + \\ \text{Y}_2\text{O}_3, + \text{Lu}_2\text{O}_3 \right] / \left[\text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \\ \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Y}_2\text{O}_3, + \text{Lu}_2\text{O}_3 \left(\text{TREO} \right) \right] \textbf{x} \ \textbf{100} \end{aligned}$
Location of data	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Sample sites are recorded using a hand held GPS with an accuracy of ± 5m.
points	Specification of the grid system used.	The grid system used is MGA94 Zone 52. All reported coordinates are referenced to this grid.
	Quality and adequacy of topographic control.	Topographic control is based on Lidar survey data collected in 2013 with accuracy considered to be better than 20cm.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	Rock chip sampling was undertaken at random intervals along strike of the mineralised structures.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity	Not Applicable

	appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	
	Whether sample compositing has been applied.	No compositing
Orientation of data in relation	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Sampling orientation was appropriate for the early stage exploration.
to geological structure	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	Not applicable – no drilling completed.
Sample security	The measures taken to ensure sample security.	Samples are collected on site under supervision of a responsible geologist and stored in on site prior to transport by company truck or utility to Halls Creek commercial transport yard. The samples were stored in a secure area until loaded and delivered to the Intertek Genalysis laboratory in Perth.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	Not considered necessary for the early stages of exploration sampling and the style of sampling undertaken.

Section 2: Reporting of Exploration Results

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The new targets and prospects are located within Mining Lease M80/627, or adjoining exploration licences E80/5040 and E80/5041. The tenements are located in the company's Browns Range Project approximately 150 kilometres south-east of Halls Creek and adjacent to the Northern Territory border in the Tanami Desert. Northern Minerals owns 100% of all mineral rights on the tenement. The Jaru Native Title Claim is registered over the Browns Range Project area and the fully determined Tjurabalan claim is located in the south of the project area.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The tenements are in good standing and no known impediments exist.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	No previous systematic exploration for REE mineralisation by companies before Northern Minerals has been completed at the potential new targets identified. Regional exploration for uranium mineralisation was completed in the 1980s without success.
Geology	Deposit type, geological setting and style of mineralisation.	The Browns Range prospects are located on the western side of the Browns Range Dome, a Paleoproterozoic dome formed by a granitic core intruding the Paleoproterozoic Browns Range Metamorphics (meta-arkoses, feldspathic meta-sandstones and schists) and an Archaean orthogneiss and schist unit to the south. The dome and its aureole of metamorphics are surrounded by the Mesoproterozoic Gardiner Sandstone (Birrindudu Group). The Browns Range xenotime mineralisation is typically hosted in hydrothermal quartz and hematite veins and breccias within the meta-arkoses of the Archaean Browns Range Metamorphics. Various alteration styles and intensities have been observed; namely silicification, sericitisation and kaolinite alteration. All rock chips and targets are located within arkosic units of the Browns Range

		Metamorphics.
		Further work is required to determine the controls on mineralisation at the new targets.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length.	Not applicable – no drilling completed.
	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.	None applied or considered necessary for the style of sampling undertaken.
Data aggregation methods	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	Not Applicable
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalents values are used for reporting of exploration results.
Relationship between mineralisation widths and intercept lengths	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	Not Applicable
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to Figures 1 & 2 in body of text.

Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	All rock chip assay results are reported.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	At Browns Range Project WA, airborne magnetic and radiometric surveys were acquired by Northern Minerals in 2011. Hyperspectral data captured during October 2012 by Hyvista Corporation Pty Ltd. Very high resolution "Ultracam" aerial photography captured by Hyvista during the Hyperspectral survey. These surveys do not extend west to cover the Longshot prospect. Regional reconnaissance including, rock chip sampling completed over new targets and prospects.
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).	RC drilling is planned to test the surface geochemical anomaly defined at the Iceman prospect. At other new targets and prospects, first-pass shallow RAB/Aircore drilling is proposed.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Refer to Figures 1, & 2 in body of text.

Section 3: Estimation and Reporting of Mineral Resources

Not applicable

Section 4: Estimation and Reporting of Ore Reserves

Not applicable
