Sampling on Vranje-South Project Defines Lithium & Borate Anomalies

HIGHLIGHTS

- Interpretation is completed on Phase two sampling data on Vranje-South project
- Preliminary stream sediment and soil surveys define a number of areas with elevated Lithium (Li) and Borate (B) values on the Vranje-South project
- Good correlation between B and Li zones defined in two areas
- Follow-up sampling program is currently being planned

Jadar Lithium Limited (ASX: **JDR**) (“**Jadar**” or “**the Company**”) is pleased to provide the following update on its phase two sampling activities at the Vranje-South project in Serbia.

The Phase one sampling program had originally consisted of scout mapping, soil & stream sediment sampling along district scale faults within the permit, to determine whether anomalous Li and B mineralisation was present. As a result of the initial program, a number of areas with elevated lithium and boron values were outlined. The Phase two work program consisted of further sampling to determine the extent and trends of the anomalies.

Phase two soil sampling results

The results of the phase two soil sampling program, in conjunction with the results from phase one, indicated a number of areas with anomalous lithium and boron values. There is generally positive correlation between the two elements in a number of zones, mainly the central and eastern portion of the license area.

The lithium values peak at 220ppm, with a number of samples grading above 150ppm. These values cluster in a number of clear trends (refer to Figure 1 for combined phase one and two Li results).

The boron values peak at 826ppm, while a number of samples cluster and define anomalous zones with B values above 300ppm.

Importantly, the two elements appear to define a similar trend and anomalous value distribution.

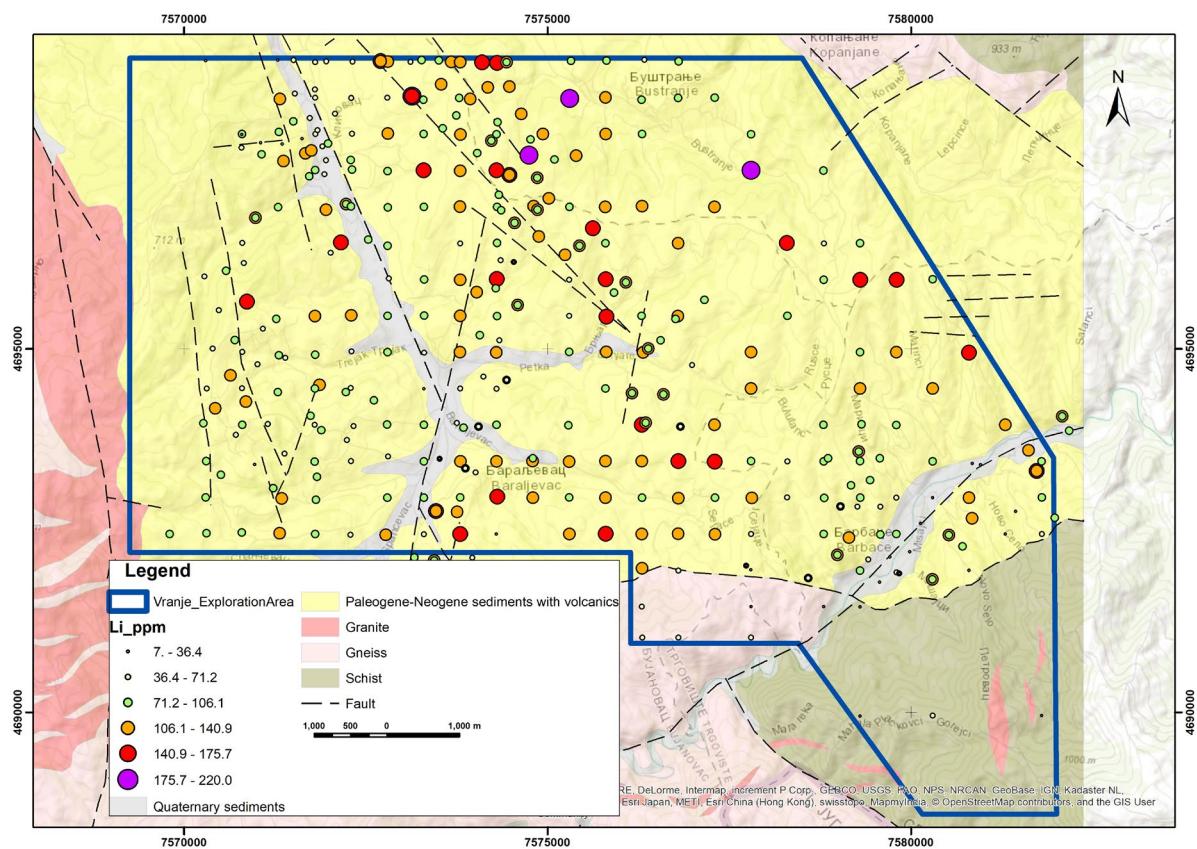

Figure 1 – Vranje-South project area with Phase 1 and Phase 2 lithium values in soil sampling

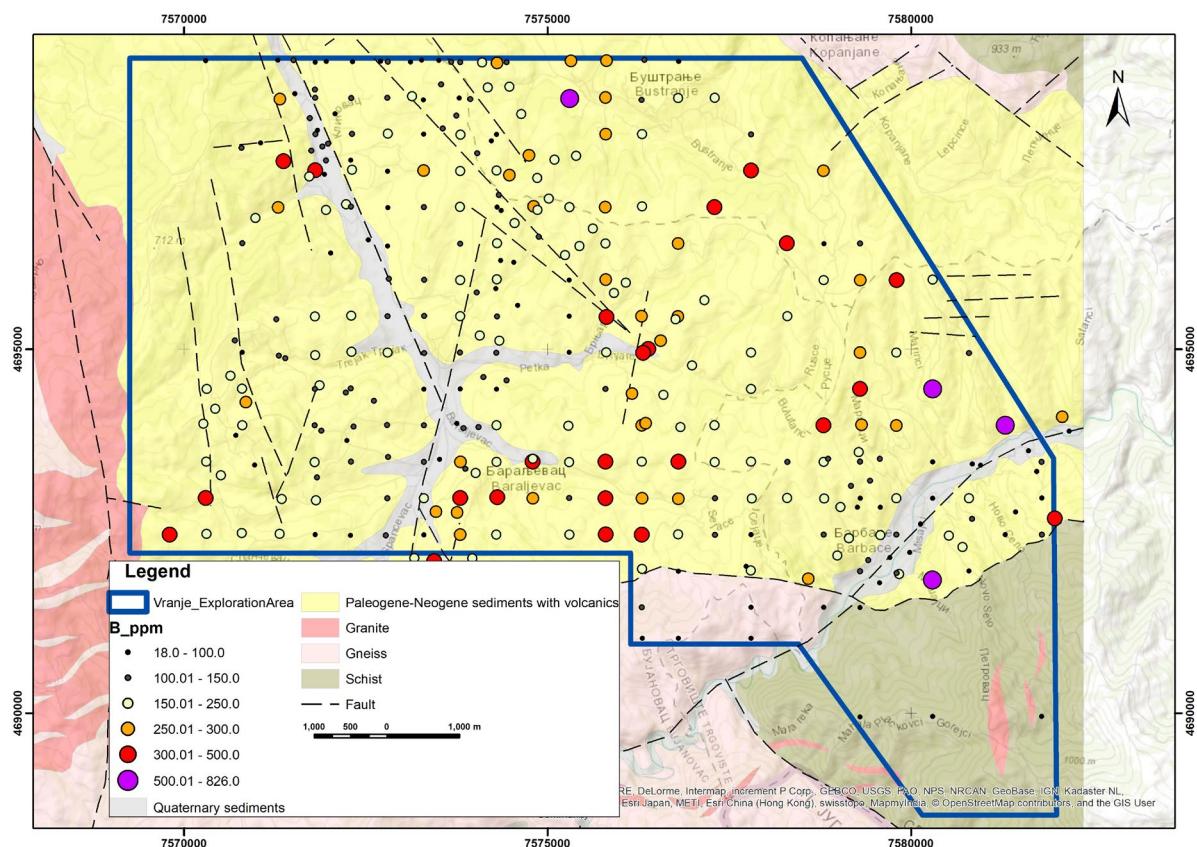

Figure 2 - Vranje-South project area with Phase 1 and 2 Boron values in soil sampling

The Company believes that the results of the second phase program provides enough evidence of Li and B anomalies on the project area, to continue with follow-up sampling and more detailed mapping, where possible, which are aimed at defining optimal drilling locations.

Planned activities for the remainder of the Quarter:

- Follow up sampling and evaluation of target areas (weather permitting)
- 3D geological modelling of the basin based on historically available data and remote sensing techniques
- Evaluation of geophysical techniques and options to define basin stratigraphy in further detail
- Preliminary geophysics on target areas to define drill target areas (weather permitting)

The Company is continuing to interpret the results it has received from phase two sampling from other projects in Serbia and on completion will update the market.

ENDS

Competent Person Statement

The information contained in this ASX release relating to Exploration Results has been compiled by Mr Jerry L Aiken, who is a Registered Member of the Society for Mining, Metallurgy & Exploration (SME). Mr. Aiken has sufficient experience that is relevant to the style of mineralization and type of deposit under consideration, and to the activity being undertaken to qualify as a competent person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the 2012 JORC Code). Mr. Aiken is a consultant to Jadar Lithium Limited and consents to the inclusion in this announcement of this information in the form and context in which it appears.

This announcement contains information extracted from a previous ASX market announcement lodged on 20 August 2018, reported in accordance with the JORC Code (2012) and available for viewing at www.jadarlithium.com.au. Jadar Lithium Limited confirms that in respect of the announcement dated 20 August 2018, it is not aware of any new information or data that materially affects the information included in the original ASX market announcement.

Disclaimer

Certain statements included in this release constitute forward looking information. This information is based upon a number of estimates and assumptions made on a reasonable basis by the Company in light of its experience, current conditions and expectations of future developments, as well as other factors that the Company believes are appropriate in the circumstances. While these estimates and assumptions are considered reasonable, they are inherently subject to business, economic, competitive, political and social uncertainties and contingencies, many of which are difficult to predict and generally beyond the control of the Company, that could cause actual results to differ materially from those expressed in, or implied or projected by, the forward-looking information and statements. Whilst the Company considers all the material assumptions to be based on reasonable grounds, there is no certainty that they will prove correct or that the outcomes indicated in the announcement will be achieved.

Forward-looking statements are statements that are not historical facts. Words such as "expect(s)", "feel(s)", "believe(s)", "will", "may", "anticipate(s)", "potential(s)" and similar expressions are intended to identify forward-looking statements. These statements include, but are not limited to statements regarding future production, resources or reserves and exploration programs and results. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information

provided by, or on behalf of, the Company. Such factors include, among other things, risks relating to lithium and other commodity prices and currency fluctuations; exploration risks; risks relating to the interpretation of exploration, sampling, drill results, the geology, grade and continuity of mineral deposits and conclusions of economic evaluations, development risks, operating risks; competition; time delays, regulatory restrictions; environmental harm and liability and additional funding requirements. Further, despite the Company having attempted to identify all material factors that may cause actual results to differ, there may be other factors that cause results not to be as anticipated, estimated or intended. Forward-looking information is no guarantee of future performance and, accordingly, investors are cautioned not to put undue reliance on forward-looking information due to the inherent uncertainty therein. Forward-looking information is made as at the date of this release (or as otherwise specified) and except as required by applicable law the Company does not undertake any obligation to update publicly such forward-looking information, whether as a result of new information, future events or results or otherwise

Repeated pulps from phase tree ME-MS89L and with analyses of B with method B-MS89L total 128 samples

Table 4. Soil sampling Phase Four, method ME-MS89L repeated pulps, with addition of B-MS89L for B – Part 1.

JORC Table 1. This table applies to the Vranje-South project work program

CRITERIA	COMMENTARY
Sampling techniques	<p>The following Stream Sediment sampling technique was followed by the Company throughout the Vranje-South project survey:</p> <p>Stream sediments comprise clastic and hydromorphic components, including detrital grains, clays, colloids, organic matter and Fe-Mn coatings on clasts. In view of this diversity it is important to collect the most appropriate size fraction consistent with the objectives of the survey. In mineral exploration the objective is to enhance the anomaly contrast (peak/background ratio) in order to increase the chances of identifying a potential mineralized bedrock source.</p> <ul style="list-style-type: none"> • Sites are selected with the following factors in mind <ul style="list-style-type: none"> - Avoid obvious sources of contamination: sample upstream (at least 50 m) from roads and habitation. - Where valleys are steeply incised avoid collapsed bank material by sampling near the center of the stream. - Avoid areas of winnowed sediment. Fine-grained material at the margins of the water course may be better. - Avoid deposits of well-sorted gravel and areas of limited sediment accumulation. - For consistency, always sample material deposited in the same setting in a stream e.g. do not mix material from heavy mineral traps with fine sediment banks. • Sample collection <ul style="list-style-type: none"> - Location was made with Garmin- GPS map 64 - Wash sieves and pans in stream immediately prior to sampling. The sieve with the 2 mm cloth is placed on top of the fine sieve and both are mounted on top of the pan. - Collect sediment from several points on the stream bed to produce a representative composite sample. The top 10–20 cm of sediment is discarded to avoid spurious high contents of Fe and Mn in oxide coatings. - Load coarse sediment into the top sieve with minimum input of water. Remove large clasts by hand and rub the material through the top sieve, wearing rubber gloves. Remove the top sieve and continue careful rubbing and shaking until adequate fine material (normally about 100 g dry weight) has passed through the lower (fine) sieve into the pan beneath. No coarse particles should be allowed to enter the fine fraction sample. - Leave sample to settle for a fixed time, typically about 15–20 minutes. During this period panned-concentrate and water samples may be collected, and site data are recorded. - Decant excess water to leave a final volume of 200–250 ml. Homogenize this by gentle agitation with stirring, and carefully decant into a clean numbered Kraft bag using a clean funnel. Place the sealed bag in a thin

	<p>polythene bag and secure with a loose knot for transportation in an upright position.</p> <ul style="list-style-type: none"> - Wash all equipment thoroughly in the stream before packing away. - Collect duplicate samples at some sites to monitor within-site variability. In a regional survey field duplicates are normally collected from every 100th site. <p>Prenumbered field cards, randomized in blocks of 100 numbers, are issued to the sampling teams. At each site the appropriate number is allocated to all sample containers, which are sealed onsite</p> <p>Sampling procedure which the Company followed for Rock sampling:</p> <ul style="list-style-type: none"> • Once the sample location has been determined, its location is defined and recorded by using a hand held GPS • Approximately 2 Kg of sample material is collected, ensuring that the sample is representative of the outcrop being sampled • The sample is placed into the sampling container, which is labeled according to the attributed sample number. • All relevant information with regard to the outcrop was recorded. <p>Sampling procedures which the Company followed for Soil sampling:</p> <ul style="list-style-type: none"> • Locate the predesignated sampling position using a hand-held GPS • In areas where deep moist soils exist, a hand soil auger is usually required to reach the soil horizon • Hand auger down to get through the humus layer and the sample is obtained approximately 20cm below the surface of the soil horizon, if possible, from the A horizon • To avoid cross contamination a nylon brush is used to clean the dirt and mud from the sampling equipment before the sample is collected. • The sample is sieved on-site using an 80 mesh sieve, 178 micrometres, using a stack of sieves with progressively finer mesh sizes. • Approximately 1-2kg of sampled material is collected • samples are placed in a labelled plastic bag (outside and a sample ticket is placed inside the bag) and is sealed onsite • The samples are stored in a dry and secure container on the project area • The samples are submitted to the laboratory while observing sample handling and handover protocols <p>Mr. Jerry Aiken is the Competent Person, as far as this announcement (and this JORC Table 1) is concerned. Mr. Aiken judges these stream sediment and rock sample results to be sufficiently reliable for the purpose of defining the main zones of</p>
--	---

	interest at Vranje-South project. The results will only be used to guide the initial phases of Jadar's work, and do not form part of any resource estimate.
Drilling techniques	Not Applicable
Drill sample recovery	Not Applicable
Logging	Not Applicable
Sub-sampling techniques and sample preparation	Not Applicable
Quality of assay data and laboratory tests	<p>The samples were submitted to the ALS laboratory in Bor (ISO 17025 accredited) for analysis: All samples were analysed by the ALS method ME0MS61L. The Company did not conduct routine QA/QC analysis on the results, including the systematic utilization of certified reference materials, blanks, and umpire laboratory check assays, as at the time of the sampling program, the Company did not have access to certified reference materials. The Company did however use uncertified internal samples which were previously whose results corresponded to expected results. All work was supervised and authorized by a person qualified under the JORC Code guidelines.</p> <p>Jadar's CP is confident that the analytical and assay techniques and QA/QC protocols implemented by the ALS laboratory were appropriate and adequate for the purposes of defining zones of interest in the area. These sample media and techniques and assays were not part of a resource estimate.</p>
Verification of sampling and assaying	<p>No drilling or mineralization reported here.</p> <p>No drilling or twinning of holes reported here.</p> <p>No adjustments were made to the assay data.</p>
Location of data points	<p>Not applicable as there is not Mineral Resource</p> <p>Stream and soil samples: Grid System: WGS84; GCS_WGS_1984 WKID: 4326; Datum: D_WGS_1984 Spheroid: WGS_1984; Angular Unit: Degree</p> <p>Stream sediment and soil sampling locations were determined by a hand-held GPS. Topographic accuracy is estimated to be within 30-50 meters. Topographic control is not considered relevant, as it does not relate to Mineral Resources</p>
Data spacing and distribution	<p>.</p> <p>The soil samples were collected on a 500m grid, where access was possible and the teams used judgement I the field to determine if the site was suitable for sampling.</p> <p>Mr. Jerry Aiken considers that the sample/data spacing and distribution which deployed in the 2018 soil survey exercise to be sufficient and adequate for orientation purposes. Infill soil</p>

	<p>sampling and further scouting will be undertaken in areas which were defined as anomalous in this survey</p> <p>No mineral resource or ore reserve is being reported.</p> <p>Sample composite was not employed.</p>
Orientation of data in relation to geological structure	<p>The stream sediment and soil surveys were designed to cover the majority of the license and on an approximate 4 samples to 1km² sampling density by the end of phase 2. The sample locations and distribution was determined by the local stream distribution, as well as, results from the first phase. The samples were located in the vicinity of the interpreted structures, which it is postulated, may act as conduits to mineralisation at depth.</p> <p>Not applicable as no drilling is reported by the company.</p> <p>Not applicable as no drilling is reported by the company.</p>
Sample security	<p>Throughout the sampling program, all prescribed sample handling protocols were adhered to. The sample handling protocols included;</p> <ul style="list-style-type: none"> • Each day after sample collection, the samples were stored in a central, secured location within the project area after being catalogued and labelled. • On completion of the sampling program, the samples were transported directly to the ALS laboratory in Bor, where relevant ALS personnel signed off the receipt of the samples. • The CP assumes that all ALS internal sample handling procedures were adhered to. <p>The CP judges that the sample handling protocols which were implemented throughout the program were sufficient to maintain sample integrity.</p>
Audits or reviews	No audits have been undertaken

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	
Mineral tenement and land tenure status	<ul style="list-style-type: none"> • Centurion Metals DOO, a 100% owned subsidiary of Jadarski resources LTD, is a 100% holder of Vranje-South mineral exploration license (License # 2225). The license is located in southern Serbia. • At time of reporting the company license is in good standing and the company plans to comply with all provisions relating to the Serbian mining law
Exploration done by other parties	<ul style="list-style-type: none"> • Historical work has been conducted on the Vranje-South project area by various Serbian and Yugoslav state geological agencies. The Company is not aware of the results of these investigations.
Geology	<ul style="list-style-type: none"> • The CP judges, from the data which is available at time of this announcement, that the mineralisation style may be related to

	blind (not outcropping) sediment hosted lithium-borate mineralisation
Drill hole Information	<ul style="list-style-type: none"> Not relevant as no drilling is being reported in this announcement
Data aggregation methods	<ul style="list-style-type: none"> No data aggregation methods were used in this announcement No metal equivalent formulas were used in reporting of any results
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> No drilling intercepts are reported here.
Diagrams	<ul style="list-style-type: none"> No drilling results are presented in this announcement.
Balanced reporting	<ul style="list-style-type: none"> The reporting here covers the area of the company's current focus. Further data analysis and interpretation may result in the definition of new targets
Other substantive exploration data	<ul style="list-style-type: none"> No information available on metallurgy, ground water, bulk density or rock stability. Integration and interpretation of the various data sets are on-going
Further work	<ul style="list-style-type: none"> The Company plans to execute further infill soil sampling in the areas defined as anomalous, make geological observations in the field. The Company plans to evaluate all available geophysical methods which may be used to define the depth and extent of the basin.. The company believes that the Soil sampling anomalies may be related to sediment hosted lithium borate mineralization at depth.
