

ASX ANNOUNCEMENT

27 November 2018

Further High Grade Intercepts at Roche Dure Metallurgical Bulk Sample Drilling Completed

Highlights

- Metallurgical bulk sampling drilling completed in 5 PQ core holes
- AVZ's extensional drilling at Roche Dure identifies additional high-grade lithium and tin mineralisation, pointing to further resource growth on the Company's maiden Mineral Resource announced in early August 2018
- MO18DD063 intersected 168.1m* @ 1.58% Li₂O & 674ppm Sn from 188.0m down-hole on drill section 6700mN
- MO18DD064 intersected 75.79m* @ 1.25% Li₂O & 1,377ppm Sn from ground surface including 2.55m of core loss down-hole on drill section 8000mN
- MO18DD065 intersected 81.88m* @ 1.38% Li₂O & 1,286ppm Sn from ground surface including 2.64m of core loss down-hole on a line approximately 20m south of drill section 7900mN
- Work is continuing on the revision of the Mineral Resource estimate using assays for holes up to and including MO18DD065. All other holes will be used to model the shape of the orebody but the assays for holes beyond MO18DD065 will not be included in the new resource model

* Down-hole length. Additional drilling is required to confirm the true-thickness of the pegmatites.

ASX Code: AVZ

AVZ's Managing Director Mr Nigel Ferguson commented: "Continued drilling at Roche Dure is increasing our knowledge of the deposit along strike, both to the south-west and north-east of the central part of the main resource area. These new results towards the "ends" of the Roche Dure pegmatite continue to add confidence to the geological knowledge of the orebody and the distribution of lithium grades further from the modelled central part of Roche Dure. It is likely that we will see an increase in resource tonnages and category at Roche Dure given they were drilled outside the maiden resource 'area of influence'. The assays reported again show strong lithium mineralisation.

We are very happy that the scale of the Roche Dure mineralisation continues to increase and we look forward to releasing an updated Mineral Resource Estimate for Manono before the end of the year with upgrade confidence in mineral resources categories."

AVZ Minerals Limited (ASX: AVZ) is pleased to report it has received further strong results from its Mineral Resource drilling at the Manono Lithium Project in the Democratic Republic of Congo. Results have been received for a further three diamond drill holes, none of which were included in the Maiden JORC Mineral Resource estimate reported in early August 2018. Assays for holes up to and including MO18DD065 will be used in the next revision of the mineral resource estimation whilst lithological interpretations from holes drilled after hole MO18DD065 will be used to model the shape of the orebody.

Metallurgical Test Work Drilling

The Company has completed drilling of 5 large diameter (PQ core) drill holes to collect bulk metallurgical samples for the planned test work associated with, and required for the Feasibility Study. The 5 holes are being geologically logged and prepared for transportation to Lubumbashi and then on to Perth for the continuation of the metallurgical test programme.

Competent Person's Statement

The information in this report that relates to geology and the exploration results is based on information compiled by Mr. Michael Cronwright, a Competent Person whom is a fellow of The Geological Society of South Africa and Pr. Sci. Nat. (Geological Sciences) registered with the South African Council for Natural Professions. Mr. Cronwright is a full-time employee of The MSA Group Pty Ltd. Mr Cronwright has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Cronwright consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

JORC TABLE 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

| Criteria | Commentary |
|------------------------------|--|
| <i>Sampling techniques</i> | <ul style="list-style-type: none"> • Diamond drilling, producing drill core has been utilised to sample the pegmatite below ground surface. This method is recognised as providing the highest quality information and samples of the unexposed geology. • Supplementing the drilling data, surface samples were collected from outcrops, utilising channel sampling from trenches and point-source sampling of scattered outcrops. • Based on available data, there is nothing to indicate that drilling and sampling practices were not to normal industry standards at the time within the Manono licence PR13359. The pegmatite has been sampled from the hanging wall contact continuously through to the footwall contact. In addition, the host-rocks extending 2 m from the contacts have also been sampled. • Diamond drilling has been used to obtain core samples which have then been cut longitudinally. Intervals submitted for assay have been determined according to geological boundaries. Samples were taken at 1 m intervals. • The submitted half-core samples typically had a mass of 3 – 4 kg. |
| <i>Drilling techniques</i> | <ul style="list-style-type: none"> • The drilling was completed using diamond core rigs with PQ used from surface to sample through to fresh-rock and HQ sized drill rods used after the top-of-fresh-rock had been intersected. Most holes are angled between 50° and 75° and collared from surface into weathered bedrock. All collars were surveyed after completion. All holes were downhole surveyed using a digital multi-shot camera at about 30 m intervals. Apart from drillholes MO17DD001, MO17DD002, MO18DD001 and MO18DD008, all core was oriented. |
| <i>Drill sample recovery</i> | <ul style="list-style-type: none"> • Drill core recovery attained >97% in the pegmatite. • Based upon the high recovery, AVZ did not have to implement additional measures to improve sample recovery and the drill core is considered representative and fit for sampling. • For the vast majority of drilling completed, core recovery was near 100% and there is no sample bias due to preferential loss or gain of fine or coarse material. |
| <i>Logging</i> | <ul style="list-style-type: none"> • Drill core was logged by qualified geologists using a data-logger and the logs were then uploaded into Geobank which is a part of the Micromine software system. The core was logged for geology and geotechnical properties (RQD & planar orientations). A complete copy of the data is held by an independent consultant. • All core was logged, and logging was by qualitative (lithology) and quantitative (RQD and structural features) methods. All core was also photographed both in dry and wet states, with the photographs stored in the database. • The entirety of all drillholes are logged for geological, mineralogical and geotechnical data. |

| Criteria | Commentary |
|---|---|
| <i>Sub-sampling techniques and sample preparation</i> | <ul style="list-style-type: none"> Core is cut longitudinally, and half-core samples of a nominal 1 m length are submitted for assay. The current programme is diamond core drilling. The sample preparation for drill core samples incorporates standard industry practice. The half-core samples have been prepared at ALS Lubumbashi and the ALS sample preparation facility on site at Manono, with holes from MO18DD021 onwards being prepared at Manono. At AVZ's onsite sample preparation facility the half-core samples of approximately 4-5 kg are oven dried, crushed to -2 mm with a 500 g sub-sample being split out. This 500 g sub-sample is then pulverised to produce a pulp with 85% passing -75um size fraction. A 120 g subsample is then split from this, the certified reference material, blanks and duplicates are inserted at appropriate intervals and then the complete sample batch is couriered to Australia for assay analysis. Standard sub-sampling procedures are utilised by ALS Lubumbashi and ALS Manono at all stages of sample preparation such that each sub-sample split is representative of the whole it was derived from. Duplicate sampling was undertaken for the drilling programme. After half-core samples were crushed at the ALS Lubumbashi and ALS Manono preparatory facility, an AVZ geologist took a split of the crushed sample which is utilised as a field duplicate. The geologist placed the split into a pre-numbered bag which was then inserted into the sample stream. It is then processed further, along with all the other samples. The drilling produced PQ and HQ drill core, providing a representative sample of the pegmatite which is coarse-grained. Sampling was mostly at 1 m intervals, and the submitted half-core samples typically had a mass of 3-4 kg. |
| <i>Quality of assay data and laboratory tests</i> | <ul style="list-style-type: none"> Diamond drillhole (core) samples were submitted to ALS Lubumbashi and ALS Manono (DRC) where they were crushed and pulverised to produce pulps. These pulps were couriered to Australia and analysed by ALS Laboratories in Perth, Western Australia using a sodium peroxide fusion of a 5g charge followed by digestion of the prill using dilute hydrochloric acid thence determination by AES or MS, i.e. methods ME-ICP89 and ME-MS91. Samples from the drilling completed in 2017 i.e. MO17DD001 and MO17DD002, were assayed for a suite of 24 elements that included Li, Sn, Ta & Nb. Samples from the drilling completed in 2018 were assayed for a suite of 12 elements; Li, Sn, Ta, Nb, Al, Si, K, Fe, Mg, P, Th and U, with Li reported as Li₂O, Al as Al₂O₃, Si as SiO₂, K as K₂O, Mg as MgO, Fe as Fe₂O₃ and P as P₂O₅. Peroxide fusion results in the complete digestion of the sample into a molten flux. As fusion digestions are more aggressive than acid digestion methods, they are suitable for many refractory, difficult-to-dissolve minerals such as chromite, ilmenite, spinel, cassiterite and minerals of the tantalum-tungsten solid solution series. They also provide a more-complete digestion of some silicate mineral species and are considered to provide the most reliable determinations of lithium mineralisation. Sodium peroxide fusion is a total digest and considered the preferred method of assaying pegmatite samples. Geophysical instruments were not used in assessing the mineralisation. For the drilling, AVZ incorporated standard QAQC procedures to monitor the precision, accuracy and general reliability of all assay results from assays of drilling samples. As part of AVZ's sampling protocol, CRMs (standards), blanks and duplicates were inserted into the sampling stream. In addition, the laboratory (ALS Perth) incorporated its own internal QAQC procedures to monitor its assay results prior to release of results to AVZ. The Competent Person is satisfied that the results of the QAQC are acceptable and that the assay data from ALS is suitable for Mineral Resource estimation. |

| Criteria | Commentary |
|--|---|
| <i>Verification of sampling and assaying</i> | <ul style="list-style-type: none"> MSA observed the mineralisation in the majority of cores on site, although no check assaying was completed by MSA. MSA observed and photographed several collar positions in the field, along with rigs that were drilling at the time of the site visit. Twinned holes for the verification of historical drilling, were not required. Short vertical historical holes were drilled within the pit but are neither accessible nor included within the database used to define the Mineral Resource. Drilling data is stored on site as both hard and soft copy. Drilling data is validated onsite before being sent to data management consultants in Perth where the data is further validated. When results are received they are loaded to the central database in Perth and shared with various stakeholders via the cloud. QC results are reviewed by both independent consultants and AVZ personnel at Manono. Hard copies of assay certificates are stored in AVZ's Perth offices. AVZ has not adjusted assay data. |
| <i>Location of data points</i> | <ul style="list-style-type: none"> The drillhole collars have been located by a registered surveyor using a Hi-Target V30 Trimble differential GPS with an accuracy of +/- 0.02 m. Positions for holes MO18DD063, 64 and 65 are from a handheld GPS and will be surveyed as per above. All holes were downhole surveyed using a digital multi-shot camera at approximately 30 m intervals. For the purposes of geological modelling and estimation, the drillhole collars were projected onto this topographic surface. In most cases adjustments were within 1 m (in elevation). Coordinates are relative to WGS 84 UTM Zone 35M. |
| <i>Data spacing and distribution</i> | <ul style="list-style-type: none"> Drillhole spacing was completed on sections 100 m apart, and collars were 50 to 100 m apart on section where possible. In situations of difficult terrain, multiple holes were drilled from a single drill pad using differing angles for each drillhole. |
| <i>Orientation of data in relation to geological structure</i> | <ul style="list-style-type: none"> The drillhole orientation is designed to intersect the Roche Dure Pegmatite at, or nearly at, 90° to the plane of the pegmatite. No material sampling bias exists due to drilling direction. |
| <i>Sample security</i> | <ul style="list-style-type: none"> When utilizing ALS Lubumbashi, chain of custody is maintained by AVZ personnel on-site to Lubumbashi. Samples are stored on-site until they are delivered by AVZ personnel in sealed bags to the laboratory at ALS in Lubumbashi. The ALS laboratory checked received samples against the sample dispatch form and issues a reconciliation report. At Lubumbashi, the prepared samples (pulps) are sealed in a box and delivered by DHL to ALS Perth. ALS issue a reconciliation of each sample batch, actual received vs documented dispatch. The ALS Manono site preparation facility is managed independently by ALS who supervise the sample preparation. Prepared samples are sealed in boxes and transported by air to ALS Lubumbashi and are accompanied by an AVZ employee, where export documentation and formalities are concluded. DHL couriers the samples to ALS in Perth. |
| <i>Audits or reviews</i> | <ul style="list-style-type: none"> The sampling techniques were reviewed by the Competent Person during the site visit. The Competent Person considers that the exploration work conducted by AVZ was carried out using appropriate techniques for the style of mineralisation at Roche Dure, and that the resulting database is suitable for Mineral Resource estimation. |

Section 2 Reporting of Exploration Results

(Criteria listed in the previous section also apply to this section)

| Criteria | Commentary |
|--|--|
| <i>Mineral tenement and land tenure status</i> | <ul style="list-style-type: none">The Manono licence was awarded as Research Permit PR13359, issued on the 28th December 2016 to o La Congolaise d'Exploitation Miniere SA (Cominiere). It is valid for 5 years. On the 2nd February 2017, AVZ formed a joint-venture (JV) with Cominiere and Dathomir Mining Resources SARL (Dathomir) to become the majority partner in a JV aiming to explore and develop the pegmatites contained within PR 13359. Ownership of the Manono Lithium Project is AVZ 60%, Cominiere 30% and Dathomir 10%.AVZ manages the project and meets all funding requirements.All indigenous title is cleared and there are no other known historical or environmentally sensitive areas. |
| <i>Exploration done by other parties</i> | <ul style="list-style-type: none">Within PR13359 exploration of relevance was undertaken by Geomines whom completed a programme of drilling between 1949 and 1951. The drilling consisted of 42 vertical holes drilled to a general depth of around 50 - 60 m. Drilling was carried out on 12 sections at irregular intervals ranging from 50 - 300 m, and over a strike length of some 1,100 m. Drill spacing on the sections varied from 50 - 100 m. The drilling occurred in the Roche Dure Pit only, targeting the fresh pegmatite in the Kitotolo sector of the project area.The licence area has been previously mined for tin and tantalum through a series of open pits over a total length of approximately 10 km excavated by Zairetain SPRL. More than 60 Mt of material was mined from three major pits and several subsidiary pits focused on the weathered upper portions of the pegmatites. Ore was crushed and then upgraded through gravity separation to produce a concentrate of a reported 72% Sn. There are no reliable records available of tantalum or lithium recovery as tin was the primary mineral being recovered.Apart from the mining excavations and the drilling programme, there has been very limited exploration work within the Manono region. |

| Criteria | Commentary |
|---|--|
| <i>Geology</i> | <ul style="list-style-type: none"> The Project lies within the mid-Proterozoic Kibaran Belt - an intracratonic domain, stretching for over 1,000 km through Katanga and into southwest Uganda. The belt strikes predominantly SW-NE and is truncated by the N-S to NNW-SSE trending Western Rift system. The Kibaran Belt is comprised of a sedimentary and volcanic sequence that has been folded, metamorphosed and intruded by at least three separate phases of granite. The latest granite phase (900 to 950 million years ago) is assigned to the Katangan cycle and is associated with widespread vein and pegmatite mineralisation containing tin, tungsten, tantalum, niobium, lithium and beryllium. Deposits of this type occur as clusters and are widespread throughout the Kibaran terrain. In the DRC, the Katanga Tin Belt stretches over 500 km from near Kolwezi in the southwest to Kalemie in the northeast comprising numerous occurrences and deposits of which the Manono deposit is the largest. The geology of the Manono area is poorly documented and no reliable maps of local geology were observed. Recent mapping by AVZ has augmented the overview provided by Bassot and Morio (1989) and has led to the following description. The Manono Project pegmatites are hosted by a series of mica schists and by amphibolite in some locations. These host rocks have a steeply dipping penetrative foliation that appears to be parallel to bedding. There are numerous bodies of pegmatite, the largest of which have sub-horizontal to moderate dips, with dip direction being towards the southeast. The pegmatites post-date metamorphism, with all primary igneous textures intact. They cross-cut the host rocks but despite their large size, the contact deformation and metasomatism of the host rocks by the intrusion of the pegmatites seems minor. The absence of significant deformation of the schistosity of the host rocks implies that the pegmatites intruded brittle rocks. The pegmatites constitute a pegmatite swarm in which the largest pegmatites have an apparent en-echelon arrangement in a linear zone more than 12 km long. The pegmatites are exposed in two areas; Manono in the northeast, and Kitotolo in the southwest. These areas are separated by a 2.5 km section of alluvium-filled floodplain which contains Lake Lukushi. At least one large pegmatite extends beneath the floodplain. The pegmatites are members of the LCT-Rare Element group of pegmatites and within the pegmatite swarm there are LCT albite-spodumene pegmatites and LCT Complex (spodumene sub-type) pegmatites. |
| <i>Drill hole Information</i> | <ul style="list-style-type: none"> See table for collar, survey and assay data. |
| <i>Data aggregation methods</i> | <ul style="list-style-type: none"> Intersections are reported as length-weighted grades within the logged pegmatite. No grade truncations were applied. The majority of samples were taken at 1 m lengths. No equivalent values are used or reported. |
| <i>Relationship between mineralisation widths and intercept lengths</i> | <ul style="list-style-type: none"> The majority of samples were taken at 1 m lengths. There is no relationship between mineralisation width and grade. The geometry of the mineralisation is reasonably well understood however the pegmatite is not of uniform thickness nor orientation. Consequently, most drilling intersections do not represent the exact true thickness of the intersected pegmatite, although intersections are reasonably close to true thickness in most cases. |
| <i>Diagrams</i> | <ul style="list-style-type: none"> The relevant plans and sections are included in this document. |
| <i>Balanced reporting</i> | <ul style="list-style-type: none"> All pegmatite intersections for holes MO18DD063, 64 and 65 are reported. |
| <i>Other substantive exploration data</i> | <ul style="list-style-type: none"> No other exploration data is available. |
| <i>Further work</i> | <ul style="list-style-type: none"> Diamond drill testing of the identified priority targets will be on-going. Drilling of 5 metallurgical test work drill holes has been completed. |
