

FURTHER OUTSTANDING RESULTS FROM REDCLIFFE DRILLING

SUMMARY

- Excellent follow-up aircore drill results at Hub prospect
- Good results also received from Aliso and Bindy North prospects
- First-pass regional aircore program now complete
- RC program to commence within weeks

Emerging Goldfields explorer NTM Gold Ltd (ASX: NTM) (“NTM” or “the Company”) is pleased to provide an update on the aircore drilling at its Redcliffe Gold Project located near Leonora, Western Australia. The program is now complete, with the latest assays yielding more highly positive results from several areas.

The Company is now moving into the next phase of exploration, with reverse circulation (RC) drilling commencing in December. The RC programme will target new areas of mineralisation identified in the aircore program. Key targets will include Hub, Infinity Redcliffe East, Redcliffe South, Bindy North and Nambi.

The aircore program consisted of 301 holes for approximately 18,000 metres. This announcement covers results for holes 18RAC186-295. Results from holes 296 to 301 remain outstanding. The program successfully identified mineralisation at a number of prospects including the Hub, Infinity, Redcliffe East and Redcliffe South (See ASX announcement 18 October 2018), and more recently, at the Aliso and Bindy North prospects. Better results include:

HUB

10m @ 3.21 g/t incl. 5m @ 5.12 g/t in 18RAC291;

2m @ 2.50 g/t to EOH in 18RAC249; and

10m @ 1.14 g/t Au in 18RAC245.

ALISO

5m @ 3.56 g/t in 18RAC275;

5m @ 1.22 g/t in 18RAC269; and

5m @ 1.12g/t in 18RAC273.

BINDY NORTH

5m @ 1.57 g/t in 18RAC261.

NTM Gold Managing Director Andrew Muir commented:

“Our aircore drilling program has delivered excellent results at a number of prospects to highlight the significant potential across the Redcliffe project area. While the Hub results are exceptional, the Aliso, Infinity, and Bindy North prospects all delivered +1g/t intercepts and will require follow-up drilling, representing new areas of mineralisation. Follow-up RC drilling is planned to commence in the next few weeks, to finish off a very successful 2018 for NTM and our shareholders. The results from the RC program are expected in the New Year, which should generate a positive news flow to kick off 2019.”

Redcliffe Project Targets and Selected Prospects over Aerial Magnetics

The aircore program was a first-pass testing phase to assess for the presence of gold mineralisation, with positive results to be followed up by deeper RC drilling. The aircore holes are drilled to blade refusal, with depths ranging from 3m to 150m, depending on the depth of oxidation. All samples were taken as 5m composites, with selected intercepts to be resampled on 1m intervals.

- ~ Shear

HUB

As announced to the ASX on 18 October 2018, drilling at the Hub prospect in the central portion of the Redcliffe Gold Project identified some outstanding gold grades including:

7m @ 4.71 g/t from 40m *incl.* **2m @ 8.68 g/t** in 18RAC176; and

10m @ 2.70 g/t from 25m *incl.* **5m @ 4.42 g/t** in 18RAC177.

Follow-up infill drilling at the Hub was expedited to further define the strike extent and to gain a better understanding of the mineralisation prior to RC drilling commencing. These follow-up aircore holes highlighted a structurally complex zone, with a number of interpreted northwest-southeast fault offsets.

The latest drilling, on 50m spaced line traverses, returned further excellent results and outlined a +200m long strike of mineralisation. Better new results include:

10m @ 3.21 g/t Au from 55m *incl.* **5m @ 5.12 g/t Au** in 18RAC291;

2m @ 2.50 g/t from 65m to EOH in 18RAC249; and

10m @ 1.14 g/t from 25m in 18RAC245.

Mineralisation remains open at depth, with the aircore drilling stopping at blade refusal.

Gold mineralisation at the Hub is hosted along a steeply east dipping sheared mafic-felsic contact. Mineralisation/alteration is silica-mica-chlorite-pyrite associated with brecciated to stockwork veining in less weathered samples towards the end of the hole.

Drilling at the northern end of the prospect intersected a north-west-north trending, largely undeformed and unmineralised magnetic mafic dyke, interpreted to be a late-stage Proterozoic dolerite dyke. The extent of the dyke is yet to be determined north of the aircore drilling. However, gravity data suggests it may be in the order of 100m to 150m wide. Significantly, there is an 800m gap to the next drill line north of the Hub. This drill line contains anomalous gold of 2m @ 0.87g/t at the end of the hole in 18RAC141. This anomalism is present in the same geological sequence as the Hub, approximately 900m from the discovery holes 18RAC177 & 178.

Locating potential extensions to the Hub mineralisation north of the dyke will be a priority for NTM in 2019.

Assay results for holes 18RAC296 to 301 remain outstanding.

NTM has planned RC drilling at the Hub in coming weeks to follow up the aircore results at depth and to better understand the geology.

Felsic (Sheared - Porphyritic)	
Black Shale (Graphitic in part)	

ALISO

Aliso is located ~7km north of the Nambi Deposit. There has been very little recorded drilling in the area and none in the immediate vicinity. NTM planned three drill traverses over 300m of interpreted strike to test anomalous gold results in soil and rock chip samples. This was the first-ever drilling at the prospect.

Anomalous gold was intersected on all three drill lines and mineralisation remains open at depth and along strike. Better intercepts include:

5m @ 3.56 g/t from 55m in 18RAC275;

5m @ 1.22 g/t from 65m in 18RAC269; and

5m @ 1.12g/t from 80m in 18RAC273.

The holes intersected a sequence of highly sheared, steep east-dipping, fine to medium grained felsic rocks including porphyry, with the base of oxidation to depths of +80m downhole.

These first-pass results are highly encouraging and represent a new mineralised area. They also confirm the Company's belief that there is good potential for mineralisation north of the Nambi Deposit within the Mertondale Shear Zone. Significantly, this area has had minimal to no drilling. There remain several other geochemical targets to the east of Aliso, which will be tested with aircore drilling in 2019.

0 50 100m

BINDY NORTH

A single line of aircore was completed 450m north of the Bindy Deposit. The line of drilling was targeted to test a similar structural setting to the Bindy Deposit, identified from the recently completed gravity survey.

The drilling successfully intersected the interpreted Bindy mineralised trend of the intermediate-felsic contact. Better results included:

5m @ 1.57 g/t within 10m @ 0.91 g/t; and

10m @ 0.5g/t from 65-75m in 18RAC261.

Regional aircore drilling from 2017 approximately 150m south of the new drill line intersected the Bindy mineralised trend with anomalous gold intersected within the saprolitic zone, giving a 450m continuous strike of anomalism north of the Bindy deposit.

The intercepts also had the distinctive grey-black cherty alteration associated with gold mineralisation at the Bindy Deposit.

Significantly, these first-pass results are comparable to the original aircore completed by NTM in 2017, which led to the discovery of the 99koz Bindy Deposit (see Appendix I for JORC compliant resource).

The mineralised shear(s) associated with the Bindy Trend can now be traced for at least 2km, open both along strike and at depth.

OTHER AREAS

Other targets tested within the just-completed program included Triple 2 North, Saturn and the Blob. Both Triple 2 North and the Blob returned anomalous results from wide-space aircore drilling. While no +1g/t intercepts were received, the results require further investigation.

Drilling at Saturn encountered mafic rocks in an area previously interpreted and mapped as an intrusive granite. While there were only very low levels of gold anomalism, further work is required to understand the geology as previous interpretations suggested that the greenstone sequence did not extend this far west.

Previously released results included (see ASX announcement 18 October 2018 for 18RAC001-185):

REDCLIFFE EAST

2m @ 3.45 g/t from 35 to EOH in 18RAC002; and

28m @ 1.22 g/t from 5m to EOH *incl.* **5m @ 4.66 g/t** and **5m @ 1.05 g/t** in 18RAC003.

REDCLIFFE SOUTH

5m @ 1.15 g/t from 60m in 18RAC073; and

5m @ 1.21 g/t from 25m in 18RAC074.

INFINITY

5m @ 0.91 g/t from 75m in 18RAC118; and

5m @ 1.32 g/t and **5m @ 1.38 g/t** in 18RAC119.

MESA WEST

4m @ 0.54 g/t from 50m to EOH in 18RAC079.

LOOKING AHEAD

NTM's aircore drilling program for 2018 has successfully identified a number of highly prospective areas with the potential to host new gold deposits. The targets were identified and ranked following an in-house review by the NTM exploration team. The Company is now confident in its key regional geological criteria used in targeting gold mineralisation within the Mertondale Shear Zone.

A follow-up RC drill program is scheduled to commence within weeks to test a number of these targets as well as existing deposits.

Following a short break over the Christmas period, the Company expects to recommence drilling early in the New Year. The target for 2019 is to have ongoing aircore and RC drilling programs throughout large parts of the year to aggressively explore the Redcliffe Gold Project.

About NTM

NTM Gold Ltd (ASX: NTM) is an emerging Perth-based explorer focused on the Leonora region, in the heart of Western Australia's Eastern Goldfields. The Leonora Laverton Terrane has produced more than 50 million ounces of gold historically and is considered to be one of Australia's most prospective provinces. NTM owns 100% of the Redcliffe Gold Project, a major developing project with established resources close to existing infrastructure and mines (e.g. St Barbara, Saracen Mineral Holdings and Red 5).

The Redcliffe Gold Project is a 170km² tenement holding covering the Mertondale Shear Zone over some 30km length. The Mertondale Shear Zone is an interpreted major crustal structure important for gold mineralisation. Exploration work has identified and delineated the Golden Terrace South (GTS) and Kelly prospects in the southern section of the Project, and the Redcliffe and Nambi prospects in the northern section. First-pass regional exploration in 2017 resulted in new discoveries Bindy, KT and Triple 2.

NTM has an experienced team who are committed to developing the Redcliffe Gold Project. An aggressive exploration program is underway, which has delivered drilling success across much of the Redcliffe project area. In June 2018 NTM announced a 94% increase in Redcliffe's Mineral Resource to 538,000oz. Since then, NTM has extended its exploration to focus on areas of Redcliffe that are largely unexplored. The Company is firmly committed to systematic exploration of this highly prospective project.

Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled and/or reviewed by Lyle Thorne, who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Thorne a full-time employee of NTM and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Thorne consents to the inclusion in the report of the matters based on this information in the form and context in which they appear.

Appendix I

REDCLIFFE RESOURCE

NTM released the Estimate of Minerals Resources to the ASX on 13 June 2018, containing the statements and consent referred to in ASX Listing Rule 5.22.

NTM confirms that it is not aware of any new information or data that materially effects the information included in the announcement of 13 June 2018 and that all material assumptions and technical parameters underpinning that estimate continue to apply and have not materially changed.

Table 1: Redcliffe Project Resource Estimate Summary – 0.5g/t Lower Cut-Off

Deposit	Indicated			Inferred			Total		
	T	g/t Au	Oz	T	g/t Au	Oz	T	g/t Au	Oz
Oxide	403,287	2.13	27,572	2,348,470	0.93	70,442	2,751,757	1.11	98,013

Grand Total	1,457,697	2.53	118,581	4,365,201	1.89	265,874	5,822,898	2.05	384,455

Notes to Table 1 and 2:

1. Totals may differ due to rounding, Mineral Resources reported on a dry in-situ basis.
2. The Statement of estimates of Mineral Resources has been compiled by Mr Andrew Bewsher who is a full-time employee of BMGS and a Member of the AIG. Mr Bewsher has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that he has undertaken to qualify as a Competent Person as defined in the JORC Code (2012).
3. All Mineral Resources figures reported in the table above represent estimates at 1st June 2018. Mineral Resource estimates are not precise calculations, being dependent on the interpretation of limited information on the location, shape and continuity of the occurrence and on the available sampling results. The totals contained in the above table have been rounded to reflect the relative uncertainty of the estimate. Rounding may cause some computational discrepancies.
4. Mineral Resources are reported in accordance with the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (The Joint Ore Reserves Committee Code – JORC 2012 Edition).

Appendix II

JORC Code, 2012 Edition – Table 1 report – AC drilling

Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	The sampling has been carried out using Aircore drilling (AC) . A total of 301 holes (18RAC01-301) were drilled in the reported program for a total of ~18,000m of AC at depths ranging from 3 to 150m. Holes were drilled at - 60 degrees at approximately 067° (Redcliffe) or to 270° (Other areas). Sample quality was high with only minimal sample loss around the annulus in the top 53m of each hole. Some samples were damp to wet as noted but overall dry sample was produced to the depths drilled
	<i>Include reference to measures taken to ensure sample representation and the appropriate calibration of any measurement tools or systems used.</i>	The drill holes were located by handheld GPS. Sampling was carried out under Company protocols and QAQC procedures as per current industry practice. See further details below.
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	AC holes were drilled with a 3.5-inch face-sampling bit, 1m samples collected through a cyclone into buckets and placed on the ground as 1m samples, generally in rows of 10. Samples are collected with a scoop to generate 5m composite samples, or variable samples at EOH. The 2-3 kg composite samples were dispatched to SGS in Kalgoorlie. These samples were sorted and dried by the assay laboratory, pulverised to form a 30gm charge for Fire Assay/AAS.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	Inclined aircore drilling was completed by Ausdrill based in Kalgoorlie.
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	The majority of samples were dry. Ground water was encountered in some holes. Sample recoveries were visually estimated and any low recoveries recorded in the drill logs. Sample quality was noted on the drill logs.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	Drill cyclone and sample buckets were cleaned between rod changes and after each hole to minimize contamination.
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	There is no observed relationship between recovery and grade in the AC drilling.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	All holes were geologically logged by NTM geologists, using the Companies logging scheme.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Logging of AC samples records lithology, mineralogy, mineralisation, weathering, colour and other features of the samples. All samples are wet-sieved and EOH samples stored in chip trays. These trays were stored off site for future reference.
	<i>The total length and percentage of the relevant intersections logged.</i>	All holes were logged in full.

Criteria	JORC Code explanation	Commentary
Sub-sampling techniques and	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	N/A.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	AC composite samples, 1m individual samples and EOH samples were collected using a scoop. Samples are recorded as dry, wet or damp. Results from the composite samples are used to identify which single meter samples will be submitted to laboratory. Composite samples are not used in resources calculations.
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Samples were prepared at the SGS Laboratory in Kalgoorlie. Samples were dried, and the whole sample pulverised to 90% passing 75µm, and a reference sub-sample of approximately 200g retained. A nominal 30g was used for the analysis (FA/AAS). The procedure is industry standard for this type of sample.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representation of samples.</i>	AC samples are collected at 1 m intervals and composited into 5 m samples using a scoop to sample individual metre samples. Certified Reference Materials (CRM's) and/or blanks are analysed with each batch of samples. These quality control results are reported along with the sample values in the final report. Selected samples are also re-analysed to confirm anomalous results.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Compositing of samples involves collection of representative scoops from within the single sample meter pile. Samples weigh 2-3kg prior to pulverisation.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample sizes are considered appropriate to give an indication of mineralisation given the particle sizes and the practical requirement to maintain manageable sample weights.
Quality of assay data and	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	Samples were analysed for Au to ppm levels via a 30-40gm fire assay / AAS finish which gives total digestion and is appropriate for high-level samples.
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	No geophysical tools were used in this program.
	<i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	For 5m composite AC sampling, Field Standards (Certified Reference Materials) and Blanks are inserted regularly within the sample sequence. At the Assay Laboratory additional Repeats, Lab Standards, Checks and Blanks are analysed concurrently with the field samples. Results of the field and Lab QAQC samples were checked on assay receipt. All assays met QAQC protocols, showing no levels of contamination or sample bias. Analysis of field duplicate assay data suggests expected levels of sampling precision, with less than 10% pair difference.
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company</i>	Significant results were checked by the MD and Exploration Manager.
	<i>The use of twinned holes.</i>	Twin holes were not employed during this part of the program.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	All field logging was carried out on hardcopy geological log sheet. Data is entered electronically at the Leonora Field office. Assay files are received electronically from the Laboratory. All data is stored in a Company database system, and maintained by the Database Manager.
	<i>Discuss any adjustment to assay data.</i>	No assay data was adjusted. The lab's primary Au field is the one used for analysis purposes. No averaging is employed.

Criteria	JORC Code explanation	Commentary
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	RC locations were determined by hand-held GPS. The drill rig mast is set up using a clinometer and rig is orientated using hand held compass.
	<i>Specification of the grid system used.</i>	Grid projection is GDA94, Zone 51.
	<i>Quality and adequacy of topographic control.</i>	Relative Levels are allocated to the drill hole collars using current Digital Terrain Model's for the area. The accuracy of the DTM is estimated to be better than 5m.
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i>	AC drilling was designed to intersect modelled oxide mineralisation within the known mineralized structures along the Mertondale Shear Zone One sample was collected for every 5 metres (maximum) drilled and selected samples submitted for assay.
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	The drilling is part of a first pass wide spaced regional exploration programme, and is not suitable for Resource estimation purposes.
	<i>Whether sample compositing has been applied.</i>	No compositing has been employed in the reported results.
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	The orientation of the drill hole (azimuth) is approximately perpendicular to the strike of the targeted mineralisation.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	The drill orientation is estimated to be approximately perpendicular to the main mineralised trend. It is unclear at present whether cross structures are mineralised, however it is considered unlikely that any sampling bias has been introduced.
Sample security	<i>The measures taken to ensure sample security.</i>	Composite samples were submitted in pre -numbered plastic bags (five calico bags per single plastic bag), sealed and transported to the Bureau Veritas Laboratory in Kalgoorlie for assaying.
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	Sampling and assaying techniques are industry-standard. No specific audits or reviews have been undertaken at this stage in the program.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	The AC drilling occurred within tenements M37/1286, M37/1295 & E37/1205 which are held 100% by NTM GOLD Pty Ltd. The Project is located 45km NE of Leonora in the Eastern Goldfields of Western Australia.
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	The tenement subject to this report is in good standing with the Western Australian Department of Mines & Petroleum.
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Previous exploration has been completed on this prospect by Ashton Gold, Dominion and CRAE in the 1990's. This work broadly outlined mineralised trends in some areas of the Mertondale Shear Zone to shallow depths resulting in the open pit mining of the Redcliffe and Mesa pits. Where relevant, assay data from this earlier exploration has been incorporated into Company databases.
Geology	<i>Deposit type, geological setting and style of mineralisation.</i>	The gold mineralisation is hosted largely within Archaean-aged felsic, sediment (inc. black shale) and minor mafic rocks. A schistose fabric is observable in the lithologies. Gold mineralisation occurs in sub-vertical to steep dipping zones associated with quartz-carbonate-sulphide-mica veins and alteration. Alteration intensity and quartz- sulphide (pyrite) abundance are controls to mineralisation in the primary zone. Depth of oxidation varies from very shallow depths (<20m) away from sheared or mineralised zones to greater than 90m within sheared or mineralised zones.
Drill hole Information	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	Refer to table in the body of text.
Data aggregation methods	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	Grades are reported as down-hole length-weighted averages of grades. No top cuts have been applied to the reporting of the assay results.
	<i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>	All higher-grade intervals are included in the reported grade intervals.
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	No metal equivalent values are used.

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	<i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i>	Due to the wide spacing of the AC drilling, the geometry of the mineralization is not known, but inferred to be broadly similar to known mineralized zones within the Mertondale Shear Zone further south. The geometry of the mineralisation at depth is interpreted to vary from steeply west dipping to sub-vertical. (80 to 90 degrees). All assay results are based on down-hole lengths, and true width of mineralisation is not known.
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Refer to Figure in the body of text.
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	Refer to results reported in body of text and summary statistics for the elements reported. All samples over 0.1 g/t Au are reported.
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	Refer to body of text and this appendix.
Further work	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Further drill testing is planned, as described in this announcement. Location of drilling is still to be determined.
