FYI REPORTS HIGH QUALITY RESULTS FROM DRILLING PROGRAM

High Purity Alumina (HPA) developer, FYI Resources Limited (the "**Company**" or "**FYI**"), is pleased to announce that it has received the results from the recently completed drilling program at the Company's 100% owned Cadoux kaolin project (EL/4673) in Western Australia.

Highlights:

- Results returned from combined diamond (DDH) and reverse circulation (RC) drilling program.
- Analysis confirms high grade, high quality HPA feedstock characteristics.
- Drilling data and results assists in progressing of BFS and project permitting.

FYI completed a combined RC and diamond drilling program (detailed in announcement 18 March 2019) on the Cadoux kaolin project to meet several key technical project objectives and contribute to delivery of a robust bankable feasibility study (BFS) for FYI's integrated HPA strategy.

The drilling program consisted of:

- 22 vertical (-90 degree) RC drill holes totalling 614 metres
- 4 angled (-70 degree) PQ triple tube diamond drill holes totalling 75 metres

The drill program generated 441 samples which were submitted to Intertek Laboratories in Perth. The samples were tested for standard kaolin suite analysis (total acid digest and Inductively Coupled Plasma (ICP) Mass Spectrometry) have now been received and analysed. A full report of the results is attached as an appendix to this announcement.

The results of the analysis reflects the demonstrated high quality of the Cadoux kaolin and its potential for feedstock for HPA.

Diamond drilling at Cadoux kaolin project April 2019

A summary of the results is provided in the table below:

Item	Result
Number of samples submitted (composites)	441
Number of samples =/> 18% Al_2O_3	93%
Highest value (Al_2O_3) - Hole GLRC003	34.7%
Average (Al_2O_3) (of all samples)	23.9%
Average metres of kaolin per drill intercept (m)	17

fyi Resources Limited

14th May 2019

As FYI's BFS progresses and the pilot plant project studies commence, undertaking the detailed drilling campaign provides the Company with:

- Increased understanding of the project's metallurgical model in terms of grade and variation of the deposit as a feedstock;
- Additional kaolin feedstock for continued metallurgical test work and pilot plant process studies;
- Critical ore characterisation for the mining and waste disposal studies;
- Hydrological study data for processes water and environmental permitting;
- Increased technical understanding and confidence in the deposit for the upgrade from a Measured to a Proven Reserve for the first phase of mining; and
- grade control data for the first phase of mining and increase the predictability of the future production schedule.

Diamond drill core from Cadoux kaolin project April 2019

Commenting on the drilling results, FYI Managing Director, Mr Roland Hill said: "The program and subsequent results of the latest round of drilling are particularly pleasing as it confirms our view that the quality of the Cadoux kaolin has excellent feedstock characteristics for HPA processing and it also provides us with specific detailed information to finalise our environmental permitting and mining study phases in preparation for mine plan application – well ahead of normal submission timeframes.

About FYI Resources Limited

FYI's is positioning itself to be a significant producer of high purity alumina (4N and 5N or HPA) in a rapidly developing LED, electric vehicle, smartphone and television screen as well as other associated high-tech product markets.

The foundation of the HPA strategy is the superior quality aluminous clay (kaolin) deposit at Cadoux and positive response that the feedstock has to the Company's moderate temperature, atmospheric pressure HCl flowsheet. The strategy's attributes combine to give a potential world class HPA project.

FYI is progressing its BFS and pilot plant production studies to de-risk the HPA project strategy.

Competent Persons Statements

Exploration Results

The information in this announcement that relates to Exploration Results is based on information compiled by Mr Stephan Hyland, a Competent Person who is a member of the Australian Institute of Mining and Metallurgy. Mr Hyland is an employee of Hyland Geological & Mining Consultants, and consultant to the Company. Mr Hyland has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity that he has undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves. The exploration results comply with recommendations in the Australian Code for Reporting of Mineral Resources and Ore Reserves (2012) by the Joint Ore Reserves Committee (JORC). Mr Hyland consents to the inclusion of the report in the form and context in which it appears.

Ore Reserves

The information in this report that relates to Ore Reserves is based on information compiled by Mr. Steve Craig, who is a Fellow of the Australasian Institute of Mining and Metallurgy. Steve Craig is a full-time employee of Orelogy Consulting Pty Ltd and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". The information is extracted from the Ore Reserve announcement released 29 October 2018 and is available to view on the Company's website at www.fyiresources.com.au .

APPENDIX 1: JORC (2012) TABLE 1

Section 1: Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Reverse circulation (RC) chip samples were collected at 1 m intervals from a cone splitter mounted on the side of the RC rig. 75% of the sample volume from each drilled metre was collected in a 900 mm x 600 mm green plastic bag, and the remaining 25% of volume is used to generate a split sample which is collected in a 200 mm x 150 mm calico bag and then placed into a green plastic bag and sealed to retain sample moisture. The split samples were collected directly from the cyclone/splitter because the samples for assay are also measured for in situ moisture. The samples were composited into 2 m samples (generated from the drill rig cone splitter) and sent to Intertek for sampling analysis + moisture testing. For the new 'Geostatistical L' RC test program pattern samples were collected at 1.0m intervals from a cone splitter on the RC rig where approximately 75% of the sample was collected in plastic bags and the remaining 25% in pre-numbered calico sample bags. Following the geological logging of the drill samples the relevant 1.0m split samples were collected and bagged for submission to the assaying laboratory. A number of selected holes and drill intervals were also sampled separately for moisture measurement determined by the "Loss on Drying" – LOD – method.
Drilling techniques	The RC drilling program used a 450 Schramm drill rig with KL rod handler, auto maker/breaker slips table, rig-mounted cone sampling system and with hammer and blade bit capabilities. Both hammer and blade drilling were employed on various selected holes to gauge variability and quality of sample return as well as to compare with repeat holes from previous drilling. For the new 'Geostatistical L' RC test program the drill rig was the same drill rig that was used in the previous drill program that is referred to in the above paragraph. All holes were completed using a hammer bit. Whilst diamond drilling was conducted – (DDH) the core was not sampled for analysis – the core was used for geotechnical purposes.
Drill sample recovery	Actual recoveries from RC drilling were measured and averaged approximately 80-90%; it is considered that samples of each hole were even sized and reported as acceptable standard. Sample recoveries from the RC drilling were weighed and measured and sizes recorded demonstrating that sample recovery from all holes was of an acceptable standard. Photos of separate chip (cuttings) trays were also taken to demonstrate the lithology profile of the hole. Selected samples were also tested for moisture content – allowing a greater confidence in sample return quality and for specific gravity testing.

fyi Resources Limited

14th May 2019

Criteria	Commentary
	For the new 'Geostatistical L' RC test program sample recoveries were assessed and logged for each 1.0m interval. Excepting for the surface 0-2m interval all drilling achieved sample recoveries >90% and were of a size and quantity that are of an acceptable standard.
Logging	RC: Chip tray samples were taken along with normal logging procedures and protocols. Two sets of logging and sample correlation was conducted on site during the drilling and sampling program. The chip tray samples were non-sieved and dry and photographed on a whole hole basis. All holes were field logged by 1 m intervals by a qualified geologist for a variety of geological qualities, characteristics and definition. For the new 'Geostatistical L' RC test program sample logging was undertaken at 1.0m intervals with non-sieved chip samples collected from each metre. Chip samples were logged by a qualified geologist and photographed.
Subsampling techniques and sample preparation	All sampling procedures for the RC and DDH drilling has been reviewed by a qualified geologists and is considered to be of a high standard. RC drilling procedure was 1 m samples split using a rig mounted cone splitter and collected in marked plastic bags. 1–2 kg was collected in small green plastic bags and 4–6 kg was collected in large green plastic bags. All samples were dry. 1–2 kg samples were brought back to Perth and sorted into composites. Composite samples were made up from the mineralized kaolin intercepted material. The composites were made using a spear making sure equal amounts were collected from each metre, thus giving a homogeneous of each metre amount in the composites. Samples were submitted to Intertek laboratories in Perth (using ICP analysis methods), Western Australia. Also using a spear technique, bulk samples were taken of the Kaolin material intercepted and samples were sent to the Bureau Veritas Australia Laboratories for x-ray fluorescence (XRF) analysis on a range of elements and kaolin parameters. The quality assurance and quality control (QAQC) information of the laboratory was used to determine the QAQC of the samples because commercial standards for kaolin are not readily available. All sampling procedures for the RC drilling have been reviewed by a qualified geologist and is considered to be of a high standard. The RC drilling sampling procedure was 1 m samples split using a rig mounted cone splitter and collected in marked plastic bags. A 2 m composite sample was generated from 1–2 kg collected in small calico bags which were then placed in small green plastic bags. These were marked with corresponding sample numbers. At regular and ad-hoc intervals, repeat samples were taken and noted as well as interspersed standard samples of quartz (blank) and kaolin (standard) were also included at a 1:9 interval as sample checks for QAQC. All samples were sent to Perth to Intertek for laboratory sampling interspersed with the RC drilling program samples. Larger (5–10 kg) samples were collected in large green plastic bags on a 1 m sample basis and sent to Independent Metallurgical Operations (IMO) for further metallurgical testwork purposes. All samples were dry. Total sample returns were measured by weighing and estimating return volume percentages. All samples were "dry" other than the occasional sample that may have been affected by water introduced by the driller to remove pipe blockages. The 2 m composite samples were generated from the rig mounted cone splitter ensuring equal amounts were collected from each metre, thus giving a homogeneous volume for each metre in the composites. Samples were submitted to Intertek laboratories in Perth, Western Australia for XRF analysis methods on a range of elements and kaolin parameters as well as testing for in-situ moisture. For the new 'Geostatistical L' RC test program samples were processes and assayed using Intertek Genalysis laboratory in Perth. The analytical technique used for all elements was XRF.
Quality of analytical data and laboratory tests	RC: Analysis for sizing, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, K_2O, Na_2O, P_2O_5, Mn_3O_4, V_2O_5, Cr_2O_3, BaO, ZrO_2, ZnO, SrO and LOI, was completed using XRF. Majority of duplicates are within tolerance of the original assay and without bias. RC: Analysis for sizing, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, K_2O, Na_2O, P_2O_5, Mn_3O_4, Cr_2O_3 and LOI, was completed using XRF methods in a globally recognized analysis laboratory. All the inserted repeat samples, duplicates, blanks and standards are within tolerance of the original assay and without significant bias. Selected RC samples were also tested for moisture (LOD) by Intertek Laboratories. The internal standard, blank and duplicate results are within acceptable limits and indicate that the field and laboratory sample preparation was under control. Both ALS and Intertek employ their own internal blank and standard testing regimes for additional QA/QC.

fyi Resources Limited

14th May 2019

Criteria	Commentary
Verification of sampling and analyses	RC: Geological personnel supervised the sampling, and infill drill holes were completed. Primary data are captured on paper in the field and then re-entered into spreadsheet format by the supervising geologist, to then be loaded into the company's database. No adjustments are made to any assay data. The RC drilling program also included verification drilling and sampling of the previous AC drilling program that was completed in May 2017. The verification included six repeat RC holes against the previous AC holes. Analysis of the chemical analysis results indicated that there was minimal bias between the two drilling types and mean grades are very similar indicating that the previous AC drilling could reasonably be used in a Mineral Resource estimate (MRE). Sample information is recorded at the time of sampling on field logging sheets using standard logging codes and then re-entered into spreadsheet format for loading to the company's database. The March/April 2019 RC and DDH drilling was also used to confirm and support the drilling of results of the previous AC and RC campaigns – with the results being regarded as very consistent. The new 'Geostatistical L' RC test program was centered on previous RC drill hole CXRC045. The test program was designed to test close range mineralization variability immediately north of and also immediately east of this hole. The N-S drill-line part of the program assisted with the verification of nearby holes CXR057 and CXR065 drilled previously.
Location of data points	All drill holes (RC and DDH) have been accurately surveyed by a licensed contract surveyor (±10 cm accuracy). The collar locations were also checked by the site geologist using a Garmin GPS at site. All holes are drilled up to a maximum of 36 m and were followed up with downhole surveying by Surtech Geophysical Services. For the new 'Geostatistical L' RC test program drill-hole collars were surveyed by a Licensed Mine surveyor using a differential GPS system with an accuracy of approximately 10cm.
Data spacing and distribution	The March/April 2019 RC drilling totaled 22 holes and was completed on a 5m linear spacing in a specially selected area of the designated first phase of mining (first 3 years) – thus providing close spaced definition of the orebody. The Diamond Drill Hole (DDH) portion of this program included 4 PQ triple tube holes angled at -70 degrees with various azimuths. This drilling was used to support the previous drilling campaigns and to provide core for both geotechnical and metallurgical characterization studies. The new 'Geostatistical L' RC test program used sample spacing of 5m along the E-W section and 5m extending out to 10m and 15m along the N-S section line.
Orientation of data in relation to geological structure	All RC drill holes were vertical given the horizontal nature of deposit. The risk of sample bias is considered to be low. The DDH holes were drilled at -70 degrees at various azimuths For the new 'Geostatistical L' RC test program drill-hole orientation were also vertical, optimally oriented to intersect the horizontal nature of mineralization profile.
Sample security	All samples were under supervision from the rig to the laboratory. All residual sample material is stored securely in sealed bags. For the new 'Geostatistical L' RC test program samples were secured in polypropylene bags, cable tied and transported to the Perth laboratory by a local freight company.
Audits or reviews	Representatives of the Competent Person (CP) from HGMC and Orelogy were responsible for the execution of the RC and DDH drilling programs. The CP's representative examined the mineralisation occurrence and were responsible for logging of the RC drilling intervals. The geological data is deemed fit for use in the MRE. Orelogy and HGMC has respectively reviewed the data internally.

Section 2: Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	The granted exploration licence 70/4673 in Western Australia, covering an area of 59 km^2.
Exploration done by other parties	White Gold Kaolin (WGK) carried out all the previous prospecting and drilling work that is on the tenement EL 70/4673. The AC drilling comprises of 47 drill holes for 824 m. The exploration work was carried out from 2011 to 2014.
Geology	The project area is underlain by weathered granitoid Archaean rock of the Yilgarn Granites is the likely parent material for the kaolin. Here, deep weathering of the feldspathic and ferromagnesian minerals within the metamorphosed granitic has resulted in the formation of kaolinite. There is no outcrop but recognizable granitoid fragmental rocks are sometimes

fyi Resources Limited

14th May 2019

Criteria	Commentary
	present just below surface. The crust of the overburden comprises gravel and sands over reddish to off-white clay. White kaolin underlies the overburden followed by weathered, partial oxidised and then fresh granitoids at depth. The recent drilling at the property has revealed a weathering profile which is very common in Western Australia with the granitoid rocks, deeply weathered forming a leached, kaolinized zone under a lateritic crust. Analysis at the Laboratory shows particle size distributions are typical of "primary style" kaolins produced from weathered granites. The crust of overburden comprises gravel and sands over reddish to off-white clay to an average depth of 5 m. White kaolin then averages approximately 16 m before orange to yellow sandy and mottled clays are intersected which are followed by recognisable rounded granitoid material. The thickness of the kaolin profile varies from less than 1 m to a maximum of 22 m. Fresh granitoids are found at depths of between 10 m and 30 m. All kaolin resources are within 4 m to 11 m of the surface.
Drill hole information	22 Reverse Circulation drill holes were drilled on an approximate 5m x 5m "L" pattern at -90 dip and 0 degrees azimuth. The Deepest hole was approximately 32m deep with the average being approximately 28.5m deep. Sample and drill hole coordinates are provided in the appendix attached to this announcement
Data aggregation methods	Cadoux's geological model required a minimum thickness intercept of 2m of kaolinite with the requirement of having to be visually bright white to be included in the estimate. Samples within the wireframe were composited to 2m intervals based on visually contiguous down-hole intervals. The sample intervals were selected by the site project Geologist. No high-grade cuts were applied. Industry standard for Kaolinite cutoffs are a maximum value of 0.7% Fe2O3, 0.5% TiO2 and 2% K2O. Assay results from drilling were all lower than the cutoff values.
Relationship between mineralisation widths and intercept lengths	All RC drill holes are vertical (-90). The orientation of the drilling is approximately perpendicular to the strike and dip of the mineralisation. The DDH were not reported for analysis – but were drilled at varying azimuths and dips – selected for geotechnical purposes
Diagrams	No diagrams included in this announcement.
Balanced reporting	The reporting is considered to be balanced
Other substantive exploration data	Nothing material to report.
Further work	Metallurgical testwork is continuing to optimize the HPA refining processes.
