

ASX ANNOUNCEMENT

ASX : LTR 22nd July 2019

Strong initial assays from resource definition drilling at Buldania extend mineralised trend to 1.4km

System remains open with further drilling required to define the limits

HIGHLIGHTS

• New intersections from recently commenced RC drill program include:

42m @ 1.0% Li₂O from 155m (BDRC0106), including:

o 14m @ 1.4% Li₂O from 173m

20m @ 1.1% Li₂O from 107m (BDR0123), including:

o 14m @ 1.3% Li₂O from 108m

12m @ 1.6% Li₂O from 170m (BDRC0131), including:

9m @ 1.9% Li₂O from 171m

(True widths 80-100% of down-hole widths listed above)

• These intersections build on the strong, shallow results reported in 2018 which included:

30m @ 1.4% Li₂O from 9m (BDDD0003), including:

o 9m @ 1.6% Li₂O from 9m

58m @ 1.2% Li₂O from 39m (BDRC0015), including:

o 16m @ 1.7% Li₂O from 44m

35m @ 1.2% from 35m (BDRC0056), including:

○ 18m @ 1.7% Li₂O from 51m

39m @ 1.6% Li₂O from 9m (BDRC0090), including:

o 13m @ 2.1% Li₂O from 21m

(See ASX releases dated 26th March 2018, 19th September 2018, 1st November 2018 and 20th November 2018)

- Latest assays combined with geological observations extend the mineralised Anna pegmatite swarm to the south-east for a minimum strike length of 1.4km.
- Mineralised system remains open both along strike and at depth.
- New data increases geological understanding, which will be incorporated into the preparation of a maiden Mineral Resource Estimate.
- Lithium mineralisation at Buldania is hosted by multiple stacked, shallowing dipping spodumene-rich pegmatites.
- The mineralisation outcrops with no weathering-related depletion of lithium.
- Reverse Circulation drilling is ongoing with ~3,000m of drilling to come.

Liontown Resources Limited (ASX: LTR) is pleased to advise that initial results from an ongoing Reverse Circulation (RC) resource drilling program at its 100%-owned Buldania Lithium Project in WA's Norseman region have extended the main zone of mineralisation at the Anna pegmatite and provided valuable geological data to aid modelling and preparation of a maiden Mineral Resource Estimate (MRE).

Buldania is Liontown's second WA lithium project, which is being advanced alongside its flagship Kathleen Valley Project where the Company recently reported a substantial resource increase (ASX Release, 9th July 2019) and is progressing a Pre-Feasibility Study.

The latest drilling at Buldania has extended the previously defined mineralisation at the Anna prospect to the south-east and east for a continuous strike length of at least 1.4km, with the system remaining open (*Figures 1 and 2*).

Mineralisation is hosted by multiple, stacked, sub-parallel pegmatite lenses which vary from ~5-25m in thickness. In places, the pegmatites merge to form zones >50m thick.

RC drilling re-commenced in June 2019 and to date 47 holes (BDRC0097-0143) have been drilled for 8,497m. Since acquiring the Buldania Project in late 2017, Liontown has drilled a total of 150 holes for 20,054.5m, including three diamond core holes for 548.5m. Refer to Appendices 1 to 3 for a full listing of significant drill statistics.

With the exception of the first nine holes (BDRC0097 - 0105), all of the drilling this year has been undertaken at the Anna prospect (see Highlights for better results to date) with the primary objective of providing sufficient data to prepare a maiden MRE.

Up to 15 further RC holes for an additional ~3,000m drilling are planned at Anna as part of this program.

Holes BDRC0097 – 0105 were drilled into a target approximately 5km north-west of Anna, where previous exploration has defined a number of spodumene-bearing pegmatites (i.e. NW Pegmatites – see Figure 5). There has been no previous drill testing of this target area and initial assays have confirmed the potential for significant lithium mineralisation with better intersections including **5m @ 1.2% Li₂O** from 20m in BDRC0104 and **6m @ 1.5% Li₂O** from 54m in BDRC0105 (*Figures 3 and 4*). Most of the NW Pegmatite area remains untested and further drilling will be undertaken as part of the current program.

The Buldania Project is located ~30km east of Norseman (~600km east of Perth) in southern Western Australia and is part of a large, ~600km², strategic land position owned by Liontown. The project is in the southern part of the Eastern Goldfields Province, a region well-known for hosting large lithium deposits including the Mt Marion and Bald Hill mines (*Figure 5*).

Just Auchard

DAVID RICHARDS Managing Director 22nd July 2019

The Information in this report that relates to Exploration Results is based on and fairly represents information and supporting documentation prepared by Mr David Richards, who is a Competent Person and a member of the Australasian Institute of Geoscientists (AIG). Mr Richards is a full-time employee of the company; and

Mr Richards has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activities being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Richards consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

This announcement contains forward-looking statements which involve a number of risks and uncertainties. These forward-looking statements are expressed in good faith and believed to have a reasonable basis. These statements reflect current expectations, intentions or strategies regarding the future and assumptions based on currently available information. Should one or more of the risks or uncertainties materialise, or should underlying assumptions prove incorrect, actual results may vary from the expectations, intentions and strategies described in this announcement. No obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

True widths ~90% downhole widths except BDRC0099 which was drilled subparallel to dip

Appendix 4 – Buldania – JORC Code 2012 Table 1 Criteria

Section 1 Sampling Techniques and Data

Criteria	Ing Techniques and Data JORC Code explanation	Commentary
Criteria Sampling techniques	Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	 Rock chip comprise representative 1-3kg chip samples collected across zone being sampled. Sub-surface samples have been collected by reverse circulation (RC) and diamond core drilling techniques (see below). Drill holes are oriented perpendicular to the interpreted strike of the mineralised trend except in rare occasions where limited access necessitates otherwise.
	 Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	 RC samples are collected by the metre from the drill rig cyclone as two 1 m cone split samples in calico bags and a bulk sample in plastic mining bags. The 1 m samples from the cyclone are retained for check analysis. Only samples of pegmatite and adjacent wall rock (~4 m) are collected for assay. HQ diamond core has been sampled in intervals of ~ 1 m where possible, otherwise intervals less than 1 m have been selected based on geological boundaries. Geological boundaries have not been crossed by sample intervals.
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	 Drilling techniques used comprise: Reverse Circulation (RC/5.5") with a face sampling hammer HQ Diamond Core, standard tube to a depth of ~200-250 m. HQ core was drilled directly from surface for all holes. Core orientation was provided by an ACT REFLEX (ACT II RD) tool.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples.	 Sample recoveries are estimated for RC by correlating sample heights in the green mining bag to estimate a recovery for each metre. For diamond core the recovery is measured and recorded for every metre. RC drill collars are sealed to prevent sample loss and holes are normally drilled dry to prevent poor recoveries and contamination caused by water
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	 ingress. Wet intervals are noted in case of unusual results. For diamond core loss, core blocks have been inserted in sections where core loss has occurred. This has then been written on the block and recorded during the logging process and with detailed photography of dry and wet core. It has been demonstrated that no relationship exists between sample recovery and grade. No grade bias was observed with sample size variation.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	 All RC drillholes are logged on 1 m intervals and the following observations recorded: Recovery, quality (i.e. degree of contamination), wet/dry, hardness, colour, grainsize, texture, mineralogy, lithology,

Criteria	JORC Code explanation	Commentary
	Whether logging is qualitative or quantitative in	 structure type and intensity, pegmatite and vein type and %, lithium mineralogy and %, alteration assemblage, UV fluorescence. Diamond core is logged in its entirety as per detailed geological description listed above. Geotechnical logging has been completed for the entire hole. Logging is quantitative, based on visual field
	nature. Core (or costean, channel, etc) photography.	 estimates. Diamond core is photographed post metre marking, for the entire length of the hole, two trays at a time, wet and dry.
	The total length and percentage of the relevant intersections logged.	Holes are logged in their entirety.
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken.	 The core has been cut in half and then quartered for sample purposes. Half core has been retained and the second quarter will be used for metallurgical studies. Density measurements have been taken on all quarter core samples using the Archimedes method.
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	RC samples are collected as rotary split samples. Samples are typically dry.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	 Sample preparation follows industry best practice standards and is conducted by internationally recognised laboratories; i.e. Oven drying, jaw crushing and pulverising so that 80% passes -75 microns.
	Quality control procedures adopted for all sub- sampling stages to maximise representivity of samples.	 Duplicates and blanks submitted approximately every 1/20 samples. Standards are submitted every 20 samples or at least once per hole. Cross laboratory checks and blind checks have been used at a rate of 5%.
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	 Measures taken include: regular cleaning of cyclones and sampling equipment to prevent contamination industry standard insertion of standards, blanks and duplicate samples Analysis of duplicates (field, laboratory and umpire) identified no issues with sampling representatively. Analysis of results from blanks and standards indicates a high level of accuracy and no issues with contamination (or sample mix-ups).
	Whether sample sizes are appropriate to the grain size of the material being sampled.	• Sample size is considered appropriate for the stage of exploration
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	 Assaying completed by Nagrom laboratories Perth. Nagrom uses industry standard procedures for rare metals such as Li and Ta. Analytical techniques are total.
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	• None used.
	Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	 Duplicates and blanks submitted approximately every 20 samples. Standards are submitted every 20 samples or at least once per hole.

ASX ANNOUNCEMENT

Criteria	JORC Code explanation	Commentary
		 Cross laboratory checks and blind checks have been used at a rate of 5%. Analysis of reference blanks, standards and duplicate samples show the data to be of acceptable accuracy and precision for the Mineral Resource estimation and classification applied.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	Internal review by alternate company personnel.
	The use of twinned holes.	• Three diamond holes are twins of existing RC drill holes. Assays compare well with the adjacent RC drill holes.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	 Drilling and logging data is entered directly into Microsoft Excel spreadsheets onsite while drilling is ongoing. Data is then entered into Access Database and validated before being processed by industry standard software packages such as MapInfo and Micromine. Representative chip samples are collected for later reference.
	Discuss any adjustment to assay data.	• Li% is converted to Li ₂ O% by multiplying by 2.15, Ta ppm is converted to Ta ₂ O ₅ ppm by multiplying by 1.22.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	 All drillholes are initially located using a handheld GPS and subsequently surveyed with DGPS. All RC drillholes have been surveyed by a multi- shot digital downhole camera provided by the drilling contractor. All diamond drillholes have been surveyed with a REFLEX EZI-SHOT (1001) magnetic single shot camera.
	Specification of the grid system used.	GDA 94 Zone 51
	Quality and adequacy of topographic control.	 Initial collar elevations are based on regional topographic dataset and GPS. Drill hole collars are surveyed post drilling with DGPS.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	 Varies due to initial drill programmes largely designed to test the strike and dip potential of mineralised outcrops. The drill section spacing is 50m to 100m and on-section spacing is generally 40 to 50m.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	Geological modelling in progress to determine whether drill hole spacing and distribution is adequate for Mineral Resource estimation.
Onlandation of	Whether sample compositing has been applied. Whether the orientation of sampling achieves	None undertaken.
Orientation of data in relation to	unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	• Drilling is typically oriented perpendicular to the interpreted strike of mineralisation.
geological structure	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	 Drilling orientation intersects the mineralisation at appropriate angles so as to be mostly unbiased and suitable for resource estimation of the major pegmatite bodies.

Criteria	JORC Code explanation	Commentary
Sample security	The measures taken to ensure sample security.	 Sample security is not considered to be a significant risk given the location of the deposit and bulk-nature of mineralisation. Nevertheless, the use of recognised transport providers, sample dispatch procedures directly from the field to the laboratory, and the large number of samples are considered sufficient to ensure appropriate sample security. Company geologist supervises all sampling and subsequent storage in field. The same geologist arranges delivery of samples to Nagrom laboratories in Perth via courier.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	None completed

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The Buldania Project is located ~600km east of Perth and 30-40km ENE of Norseman in Western Australia. The Project area totals ~67km ² and comprises 1 granted exploration licence (EL 63/856), 1 granted prospecting license (PL63/1977) and 1 granted mining lease (M63/647) – the "Tenements".
		The Tenements are held by Avoca Resources Pty Ltd which is a wholly owned subsidiary of RNC Minerals Ltd. RNC Minerals acquired Avoca Resources Pty Ltd from Westgold Resources Ltd in 2019
		Liontown Resources Limited through its wholly owned subsidiary, LRL (Aust) Pty Ltd, acquired the lithium and related metal rights for the Buldania Project in late 2017 by agreeing to:
		 Issue 10,000,000 Liontown shares to Westgold (completed);
		 paying ongoing statutory rents and rates for the Tenements while the Agreement is current; and
		 paying Avoca \$2 per tonne of ore mined and 1.5% of the gross sales receipts in respect to any lithium or related metals extracted from the Tenements.
		Avoca retains the rights to all other metals (excluding lithium and related metals) and has priority access for exploration.
		The Tenements are covered by the Ngadju Determined Native Title Claim (WCD2014/004). Avoca has an Access Agreement with the Ngadju which will apply to Liontown's exploration activities.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	All tenements are in good standing.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Multiple phases of exploration completed for gold and nickel. This has not been reviewed in detail due to

Criteria	JORC Code explanation	Commentary
		Liontown only having the rights to lithium and related metals.
		There has been no previous exploration for lithium and related metals; however, past explorers have mapped large pegmatite bodies and recorded spodumene mineralisation in a number of places.
Geology	Deposit type, geological setting and style of mineralisation.	The Buldania Project contains a series of quartz- feldspar-muscovite-spodumene pegmatites largely hosted in mafic rocks. The Project is located at the southern end of the Norseman- Wiluna Belt within the Archaean Yilgarn Craton close to the boundary with the Proterozoic Albany Fraser Province.
		The pegmatites are interpreted to be LCT type lithium bearing-pegmatites.
Drillhole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes: easting and northing of the drillhole collar elevation or RL (elevation above sea level in metres) of the drillhole collar dip and azimuth of the hole down hole length and interception depth hole length. 	See Appendix in accompanying report.
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	Li ₂ O intercepts calculated using 0.3% cut off with a maximum 2m internal dilution. Higher grade intervals calculated using 1.0% cut off. No upper cuts applied.
		Ta_2O_5 values only quoted when lithium intersections reported.
Relationship between mineralisation widths and intercept lengths	If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	For true widths please refer to appendices in accompanying report.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	See figures in accompanying report
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	All recent exploration results reported and tabulated.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All meaningful and material data reported
Further work	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	 Complete resource definition drilling at Anna; and Undertake initial drill testing of NW Pegmatite area.
