

25 October 2019

ASX RELEASE

## Option to Acquire Portfolio of Western Australian Iron Ore Assets

- Exclusive option to acquire a portfolio of drill tested bedded and channel type iron ore assets covering a landholding of **874km<sup>2</sup>**
- **Tom Price- Hematite & CID Project:**
  - Located **adjacent to Rio Tinto's Western Turner Syncline Open Pit Mine which contains proven and probable reserves of 278Mt at 61.8%Fe<sup>1</sup>**
  - Rock chip sampling of hematite mineralisation returned **up to 66% Fe**
  - Multiple significant channel iron drilling intercepts across **1,400m strike** include;
    - RC15BULL0016: **14m at 55.58% Fe from 18m**
    - RC15BULL0017: **18m at 54.91% Fe from 16m**
    - RC15BULL0018: **12m at 54.94% Fe from 24m**
    - RC15BULL0019: **18m at 54.65% Fe from 16m**
    - RC15BULL0021: **22m at 55.19% Fe from 14m**
    - RC15BULL0022: **22m at 55.41% Fe from 14m**
    - RC15BULL0023: **22m at 55.17% Fe from 10m**
    - RC15BULL0024: **16m at 55.17% Fe from 10m**
- **West Pilbara CID Project:**
  - Located 180km via sealed Great Northern Highway to Cape Preston
  - **>40km of strike of mapped CID**
- **Wiluna West Hematite Project:**
  - Located directly along strike to south of GWR Group Ltd's Wiluna Iron Ore Project which contains a mineral resource of 131Mt at 60% Fe<sup>2</sup>
  - Multiple significant hematite drilling intercepts include:
    - WWRC2855: **18m at 56.88% Fe from 23m**
    - WWRC0119: **13m at 59.54% Fe from 22m**
    - WWRC0118: **5m at 57.76% Fe from 7m**
    - WWRC0120: **5m at 60% Fe from 59m**
- **Mt Padbury Hematite Project:**
  - Multiple significant hematite drilling intercepts include:
    - HMP19: **92m at 55.4% Fe from surface**
    - HMP010: **53m at 56.0% Fe from 3m**
    - HMP14: **43m at 55.1% Fe from 4m**
    - HMP15: **28m at 53.4% Fe from 4m and 20m at 57.9% Fe from 54m**
    - HMP17: **47m at 54.7% Fe from 4m**
    - HMP21: **49m at 56.9% Fe from 16m**
    - HMP22: **15m at 55.4% Fe from surface**
- Portfolio review underway by Company to prioritise focus of further exploration and potentially develop multiple existing infrastructure pathways
- Acquisition subject to due diligence and shareholder and regulatory approvals

<sup>1</sup> Rio Tinto Annual Report, 2<sup>nd</sup> March 2018

<sup>2</sup> GWR Group Ltd Annual Report, 30<sup>th</sup> October 2018

Tao Commodities Limited (“TAO” or “the **Company**”) (ASX: TAO) is pleased to announce that it has entered into an exclusive binding term sheet for the option to acquire 100% of DSO Mining Pty Ltd (“**DSO**” or “**DSO Mining**”) (“**Term Sheet**”). Pursuant to the Term Sheet, DSO has rights to a portfolio 26 tenements, comprised of 3 granted exploration licences and 23 pending exploration licences for bedded and channel iron type iron ore projects covering a total of 874km<sup>2</sup>.

Executive Director, Patrick Glovac, commented “*The acquisition of DSO Mining exposes TAO to multifaceted iron ore exploration projects with an extensive footprint across Western Australia. The portfolio includes advanced drill tested targets proximal to infrastructure solutions.*

*We look forward to further evaluating each of the opportunities within the portfolio to prioritise the advancement of each of the respective projects and expedite exploration across the priority assets.”*

**Figure 1: Project Location Plan & Ports**

## Tom Price- Hematite/Detrital/Channel Iron Project

The Tom Price Project is located 6km to the west of the Tom Price township and covers a land area of 74km<sup>2</sup>. The Project is located 15km north-west of the Mount Tom Price Mine and the Western Turner Syncline Mine, operated by Rio Tinto is located directly adjacent to the north of the Project. The Western Turner Syncline Mine contains proven and probable reserves of 278Mt at 61.8% Fe<sup>3</sup>.

Figure 2: Tom Price Project

### Project Geology & Mineralisation

The project area is located along the south-dipping, northern limb of the Mount Turner Syncline. Here, rocks of the upper Fortescue Group, including laterally extensive dolerite sills, are overlain by the Hamersley Group. Most of the tenement straddles mafic volcanic rock and siliciclastic sedimentary rock of the Jeerinah Formation at the top of the Fortescue Group. These rocks are intruded by mafic sills which are part of the Fortescue Group. In the northwest and northeast corners of the tenement, rocks of the underlying Bunjinah Formation outcrop. Along the southern margin of the western part of the tenement, rocks of the Boolgeeda Iron Formation are exposed over a strike length of more than 4 km. The eastern portion of the tenement incorporates a portion of a river valley containing partly consolidated and cemented colluvium.

<sup>3</sup> Rio Tinto Annual Report, 2<sup>nd</sup> March 2018

Multiple mineralisation styles including channel iron deposits (CID), detrital iron deposits (DID) and bedded iron mineralisation have been identified within the Project. Outcropping Weeli Wollli Iron Formation returned encouraging results during recent field mapping programs.

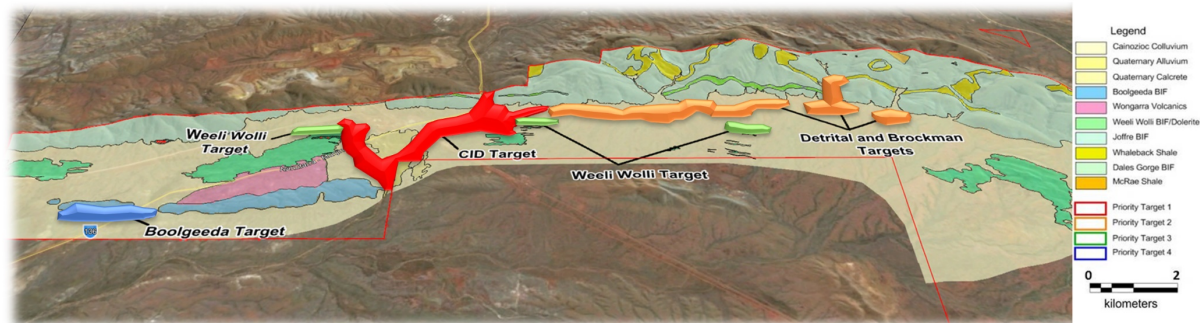

Figure 3: Target Areas with interpreted 1:20,000 Scale Geological Mapping

### Exploration Completed

Exploration targeting, field mapping and rock chip sampling was undertaken by DSO Mining in early 2019. A total of 12 rock chip samples were taken and reported results between 25.6 to 66% Fe (refer to *Appendix 2: Tom Price Rock Chip Sampling Results* for full listing of results).

RC drilling was completed by API Management Pty Ltd (API)<sup>4</sup> during 2008 and by Rio Tinto in 2014 to 2017. A total of 18 RC holes for 1,400m were completed across a strike length of 1,350m.

Significant CID drilling intercepts include (refer to *Appendix 3* for full results):

- RC15BULL0007: **14m at 50.29% Fe from 6m**
- RC15BULL0012: **22m at 52.91% Fe from 14m**
- RC15BULL0013: **22m at 53.87% Fe from 16m**
- RC15BULL0017: **16m at 54.32% Fe from 10m**
- RC15BULL0015: **12m at 51.77% Fe from 20m**
- RC15BULL0016: **14m at 55.58% Fe from 18m**
- RC15BULL0017: **18m at 54.91% Fe from 16m**
- RC15BULL0018: **12m at 54.94% Fe from 24m & 6m at 52.35% Fe from 40m**
- RC15BULL0019: **18m at 54.65% Fe from 16m**
- RC15BULL0020: **22m at 54.06% Fe from 14m**
- RC15BULL0021: **22m at 55.19% Fe from 14m**
- RC15BULL0022: **22m at 55.41% Fe from 14m**
- RC15BULL0023: **22m at 55.17% Fe from 10m**
- RC15BULL0024: **16m at 55.17% Fe from 10m**

<sup>4</sup> API Management is the manager of two joint ventures (Australian Premium Iron JV between Aquila/Baosteel, AMCI and Posco and the Red Hill Iron Ore JV which is comprised of APIJV and Red Hill Iron

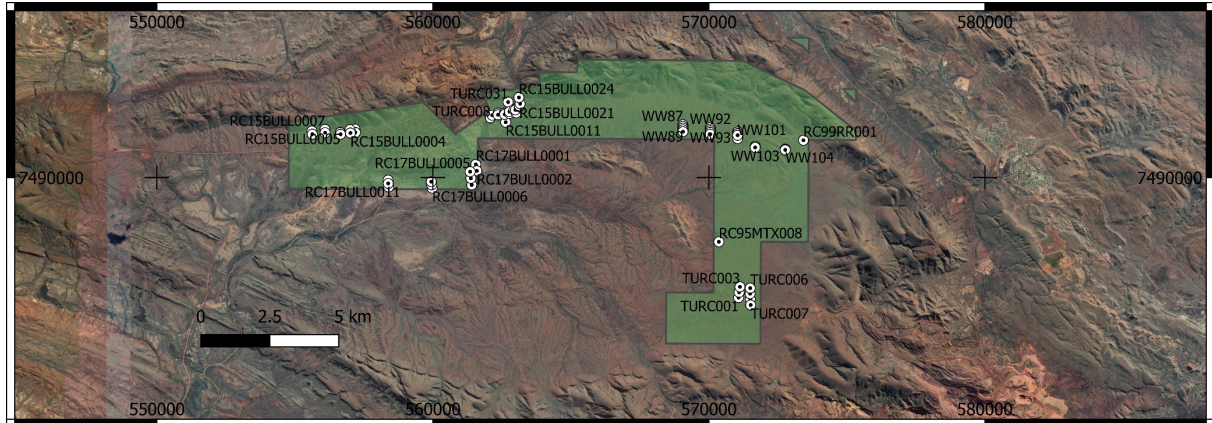

Figure 4: Tom Price Drill Collar Plan

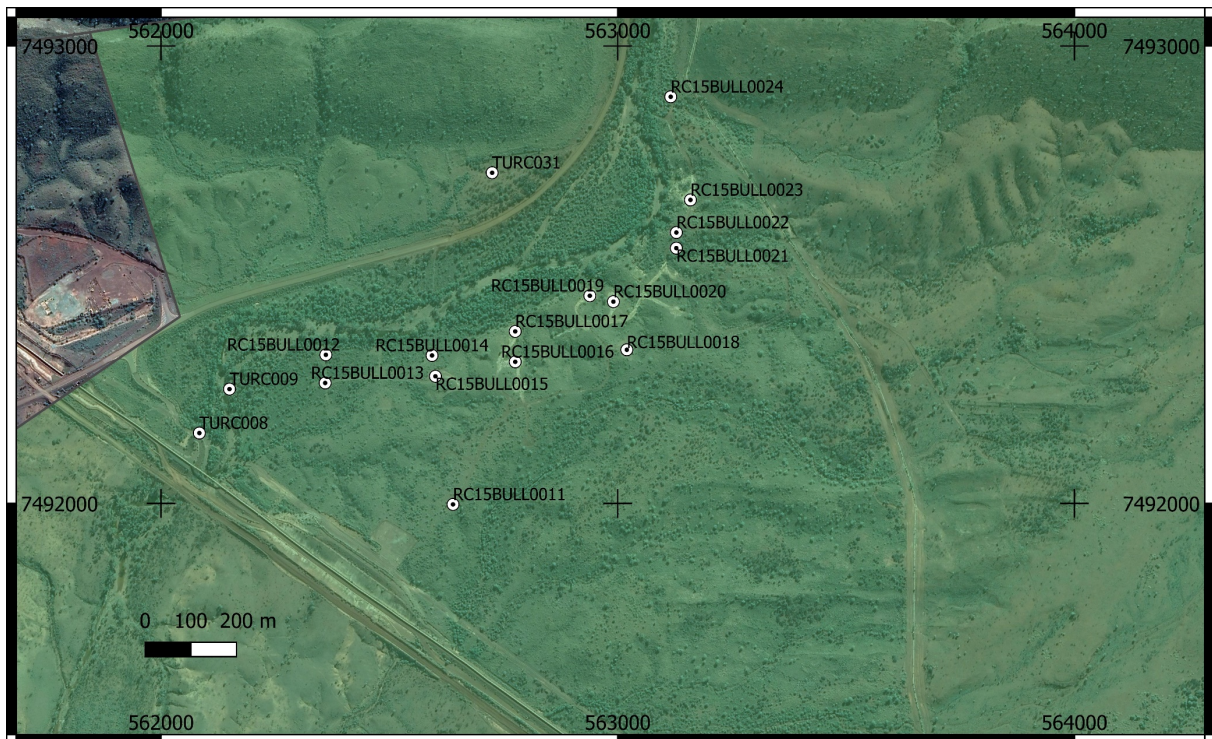

Figure 5: Tom Price- CID Target Collar Plan

Figure 6: Tom Price CID Drill Section (Looking North-East)

## West Pilbara CID Project

The West Pilbara CID Project is comprised of four discrete project areas:

- Pannawonica - Located directly south of the township of Pannawonica and to the east of the Robe River Mine
- Deepdale - Located 35km west-south-west of Pannawonica
- Cane River - Located 76km south-east of Onslow, 188km west-south-west of Karratha and 150km south-west of Cape Preston
- Mt Stuart and Duck Creek - Located 75km south of Pannawonica. The Mt Stuart and Duck Creek Projects are located directly along strike to the north and south respectively of API's Catho Well CID Deposit<sup>5</sup>.

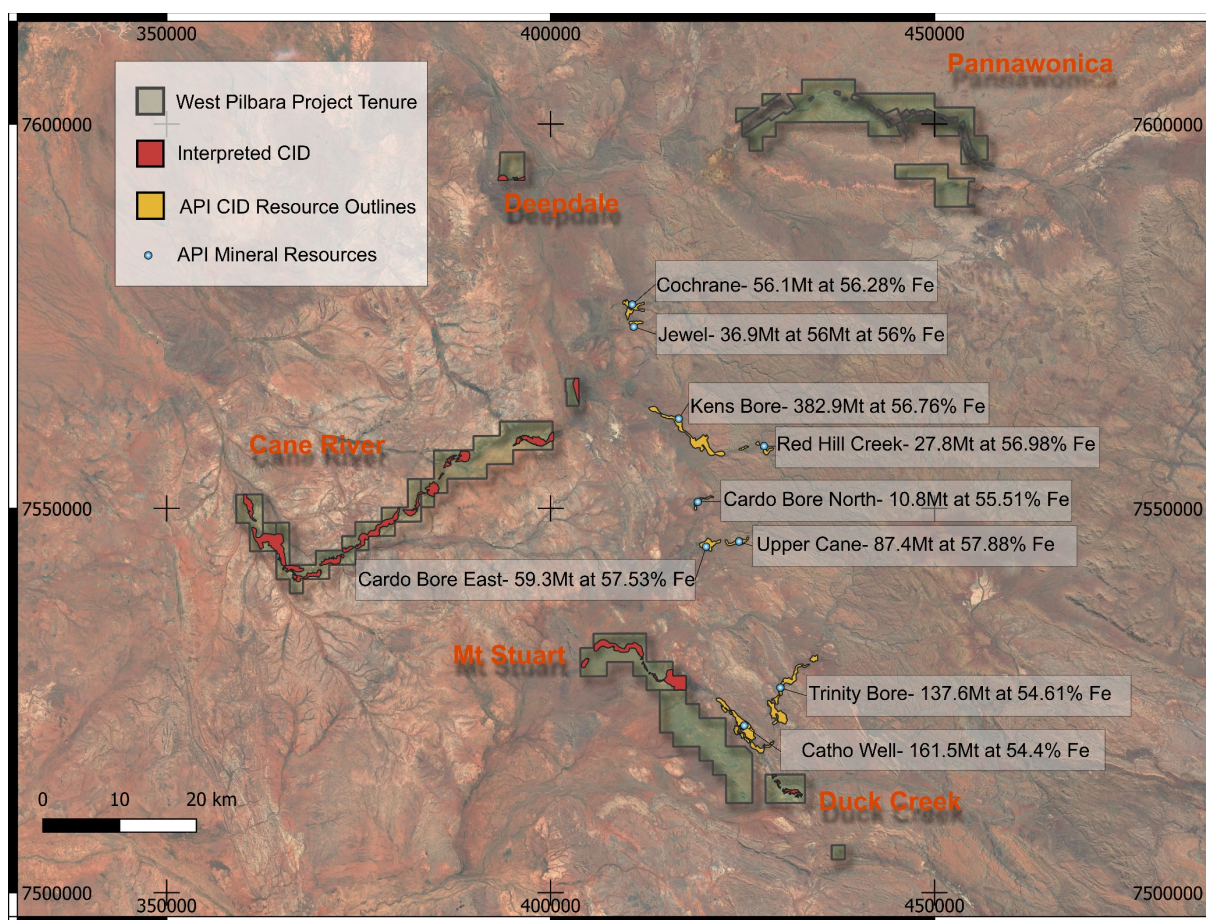

Figure 7: West Pilbara Project Tenure, CID Interpretation and Adjacent CID Projects

<sup>5</sup> References to API Mineral Resources from Red Hill Iron Market Release 24<sup>th</sup> November 2016, *Red Hill Iron Ore Joint Venture- Mineral Resources Update*

## Cane River CID Project

The Cane River CID Project is located 170km south-south-west of Karratha and 180km via the Great Northern Highway to the Cape Preston Port. The Cane River CID Project covers an area of 172 km<sup>2</sup> and contains mapped and interpreted palaeochannels which have the potential to host channel iron deposits. Outcropping CID targets extend for >40km of strike length.

Minimal exploration has been completed on the Project during decades of ownership by Mineralogy Pty Ltd. Drilling is confined to the eastern most portion of the Project and was completed by Dynasty Metals Australia Ltd (Dynasty) during 2009 and Fortescue Metals Group Ltd (Fortescue) during 2014.

Dynasty drilling was completed to the south of the mapped palaeochannels, no significant results were returned. Fortescue drilling targeted outcropping CID mesas and buried CID within their Red Hill Project. 17 RC drillholes were completed for a total of 252m. Each hole was drilled to Ashburton basement sediments. CID was intersected with varying results. Three drillholes intersected significant CID mineralisation (refer to *Appendix 4* for full results):

- WP0040: 4m @ 48.9% Fe from 0m and 1m @ 53.8% Fe from 13m
- WP0041: 4m @ 52.2% Fe from 0m
- WP0036: 2m @ 50.9% Fe from 4m

**Figure 8: Cane River CID Project**

**Figure 9: Cane River- Surficial Pisolite Mineralisation**

### **Mt Stuart and Duck Creek CID Project**

The Mt Stuart and Duck Creek Channel Iron Projects cover the northern and southern extensions of API's Catho Well Deposit respectively.

The Projects are located within the Ashburton Fold Belt, northwest of the Wyloo Dome and along the southwestern limb of the Duck Creek Syncline. The area lies approximately 30 km east of the Hamersley Basin margin. Basement geology within the area consists of middle-upper formations of the Wyloo Group, including, from oldest to youngest, the Duck Creek Dolomite, the June Hill Volcanics, and the Ashburton Formation.

The principal objective of both project areas is to explore for, and evaluate, channel iron deposits, draining west from the banded iron formations of the Hamersley Range, across a coastal plain of Ashburton Basin sediments.

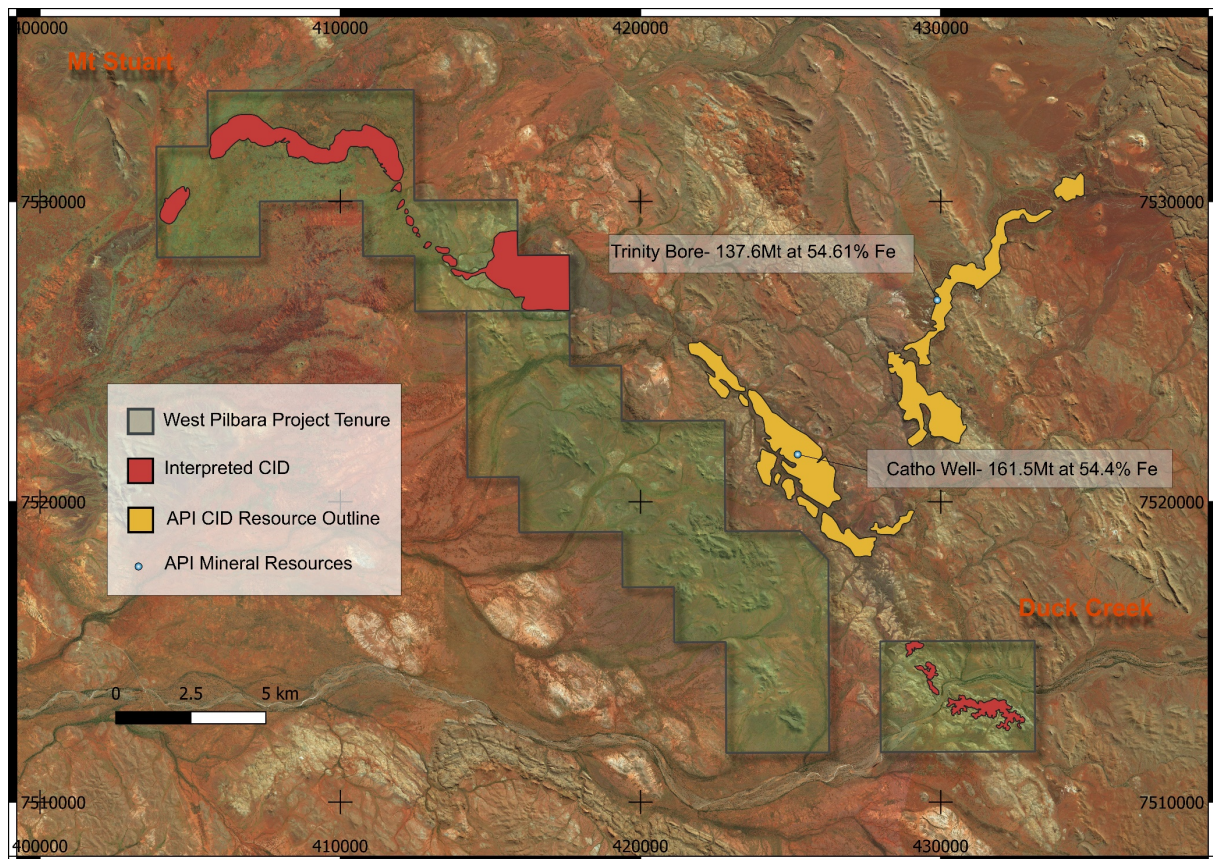

The Mt Stuart CID Project has been subject to two phases of iron ore drilling. Fortescue completed 24 reverse circulation holes for a total of 510m during 2016. The drilling targeted a previously mapped palaeochannel stretching the length of their project. Results of the 2016 RC drilling campaign were deemed to be encouraging and a further 24 holes were completed for a total of 486m during 2018.

Multiple drillholes intersected significant CID mineralisation (refer to *Appendix 5* for full results):

- WP0133: **2m @ 51.8% Fe from 5m**
- WP0134: **2m @ 51.6% Fe from 6m**
- WP0138: **2m @ 52.8% Fe from 2m**
- WP0143: **4m @ 53.9% Fe from 2m**
- WP0146: **2m @ 52.8% Fe from 0m**
- WP0149: **6m @ 53.6% Fe from 0m**
- WP0155: **8m @ 52.2% Fe from 0m**
- WP0164: **4m @ 54.3% Fe from 3m**
- WP0165: **3m @ 56.6% Fe from 4m**
- WP0167: **2m @ 52.1% Fe from 2m**  
and **2m @ 54.1% Fe from 6m**
- WP0168: **2m @ 51.7% Fe from 3m**  
and **2m @ 53.7% Fe from 6m**  
and **3m @ 52.3% Fe from 9m**

- WP0169: 9m @ 52.3% Fe from 4m
- WP0172: 2m @ 51.8% Fe from 10m
- WP0173: 5m @ 52.4% Fe from 7m

Minimal exploration has been completed on the Duck Creek Project, with exploration limited to surface sampling.

6 **Figure 10: Mt Stuart and Duck Creek Projects**

### Pannawonica CID Project

The Pannawonica Project contains a considerable strike length of the Robe River. The Robe River has dissected a vast extent of the mesas which host CID mineralisation and consequently contains unconsolidated iron pisolites and sands which were eroded from these mesas.

<sup>6</sup> References to API Mineral Resources from Red Hill Iron Market Release 24<sup>th</sup> November 2016, *Red Hill Iron Ore Joint Venture- Mineral Resources Update*

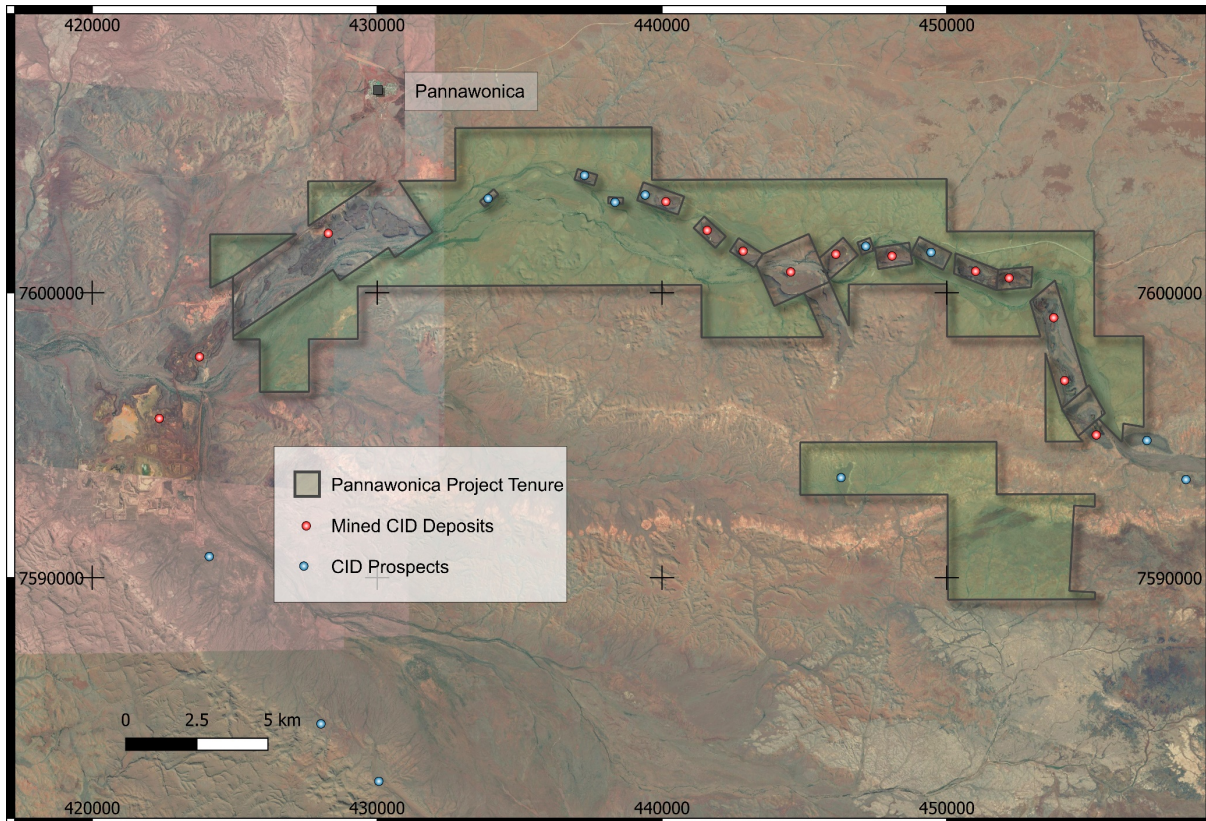

Figure 11: Pannawonica Project Plan

Figure 12: Robe River Pisolite Target

## Wiluna West- Hematite Project

The Wiluna West Hematite Project is located 35km west-south-west of the township of Wiluna and directly along strike to the south of GWR Group Limited's (ASX: GWR, "GWR") Wiluna West Iron Ore Project ("WWIOP"). Access to the Project from Wiluna, is via the Goldfields Highway thence via the Sandstone-Wiluna Road.

### Project Geology & Mineralisation

The Project is located within the central extent of the Joyners Find Greenstone Belt, near the north-eastern margin of the Yilgarn Craton. The Joyners Find Greenstone Belt is a narrow (5-10km) north-south striking sequence of prominent ridges of banded iron formation ("BIF") intercalated with mafic and ultramafic schists containing minor chert and clastic sediment horizons.

The majority of the lithological units within the Joyners Find Greenstone Belt are north to north-north-westerly trending, sub-vertical to steep westerly dipping. Folds developed within the D2 deformation event are observed in the BIF ridges as tight to isoclinal structure orientated north-south with west dipping axial planes. The BIF ridges are variably deformed and intensely folded.

Hematite mineralisation occurs within two main BIF ridges, surrounded by interbedded mafic and ultramafic units. Mineralised horizons appear to be controlled by structural deformation.

### Exploration Completed

Extensive RC drilling has been completed between 2005 to 2014 by GWR. Significant results include:

- WWRC2855: **18m at 56.88% Fe from 23m**
- WWRC0119: **13m at 59.54% Fe from 22m**
- WWRC2147: **10m at 55% Fe from 12m**
- WWRC925: **9m at 55.97% Fe from 14m**
- WWRC0113: **6m at 55.31% Fe from 2m**
- WWRC2872: **5m at 63.62% Fe from 110m**
- WWRC1389: **5m at 56.52% Fe from 9m**
- WWRC0118: **5m at 57.76% Fe from 7m**
- WWRC0120: **5m at 60% Fe from 59m**
- WWRC1384: **4m at 59.78% Fe from 19m**
- WWRC1390: **4m at 58.23% Fe from 73m**
- WWRC2867: **3m at 60.83% Fe from 52m**
- WWRC2856: **3m at 60.13% Fe from 74m**

Refer to *Appendix 6* for full results.

Figure 13: Wiluna West Historical Drilling by GWR 2004-15

## Mt Padbury- Hematite Project

The Mt Padbury Project is located 150km to the north of the Meekatharra township. Access to the project is via the Great Northern Highway thence the Ashburton Downs-Meekatharra Road to Horseshoe Road.

*Figure 14: Mt Padbury Location Plan*

### Project Geology & Mineralisation

The Mt Padbury Project is located within the Padbury Basin, comprised of Palaeoproterzoic sedimentary and mafic volcanic lithologies deposited in a foreland basin setting. Lithologies have been deformed in a fold and thrust belt during the Capricorn Orogeny arising from the collision of the Archean Pilbara and Yilgarn Cratons.

Four major compressional and deformational events which have resulted in complex folding, faulting and shearing of the basin sediments and volcanic rocks.

The Padbury Group of lithologies comprises of the following four stratigraphic units, the Labouchere, Wilthorpe, Robinson Range and Millidie Creek Formations. Locally these formations unconformably overlie the Horseshoe Formation of the Bryah Group, but in places are in faulted contact with the underlying Bryah Group or Archaean gneiss of the Narryer Terrane.

Mapping completed by the Geological Survey of Western Australia (“GSWA”) has delineated several iron-rich regolith units within the Peak Hill region. Units include remnants of the extensive lateritic cover developed over the region in humid sub-tropical conditions during the Cainozoic. Quaternary iron rich colluvium and alluvium units have also been mapped.

*Figure 15: Hematite Mineralisation Outcrop at Mt Padbury*

## Exploration Completed

Extensive geological mapping of the project area has been conducted at 1:5,000 scale across the tenure. In areas of particular interest, such as hematite pods the mapping scale changed to 1:1,000.

Mapping has indicated that three discrete Banded Iron Formations are present within the Robinson Range Formation across the Project. Two distinct geological domains were targeted:

- The southern domain has been folded into a series of open regional scale folds. This folding has resulted in thickening of the BIF units in the fold hinge areas
- The northern domain consists of stratigraphy which has been attenuated into narrow, linear belt with very little folding.

The mapping shows that the BIF units in the southern domain are thicker, better developed, and have a better magnetic response than those in the northern area. The characteristics indicate that the southern domain is more prospective and should form the focus of further exploration.

A total of 22 rock chip samples were taken across the hematite outcrops with assay results ranging between 35.7-63.3% Fe, the rockchipping was completed by Austsino Resources Ltd (ASX: ANS, formerly Padbury Mining Ltd, “ANS”). The hematite mineralisation is developed along a strike length of 700m. Mineralisation is consistent with an area of interpreted magnetite destruction seen in the

aeromagnetic data. The platy style of hematite mineralisation observed is interpreted to be of either metasomatic or hydrothermal origin.

## Goldsworthy, Shay Gap, Spinifex Ridge, Mt Maguire, Emu, Woolshed and Carina Iron Ore Projects

In addition to the above-mentioned projects, pursuant to the Term Sheet, DSO Mining also has the rights to seven additional projects which are presently being evaluated by TAO. The Projects are prospective for hosting iron mineralisation and further work is required to define their potential.

**Figure 20: Project Portfolio**  
*seven additional projects, being Goldsworthy, Shay Gap, Spinifex Ridge, Mt Maguire, Emu, Woolshed, Carina*

## Capital Raising

A capital raising of \$2,500,000 at an issue price of \$0.12 per share will be completed concurrently with and subject to the shareholder and regulatory approval of the Acquisition.

Funds raised will be used for exploration expenditure on the Projects, to maintain the tenements, progress the tenements which are in application phase, and for general working capital.

## Material Terms of the Acquisition

TAO, DSO and the vendors of DSO (“**Vendors**”) have executed a Binding Term Sheet providing a twenty one day exclusive option (“**Option**”) for TAO to acquire 100% of the issued capital of DSO Mining (“**Acquisition**”).

In consideration of TAO being provided with the Option, TAO has paid a non-refundable option fee via the issue of 416,667 Fully Paid Ordinary Shares. TAO may exercise the Option (at its sole election) at any time during the option period.

Subject to all necessary ministerial consents, DSO will become the sole legal owner of the granted tenements and the beneficial owner of the tenements which are in application phase.

The Acquisition consideration is comprised of:

- the option fee of 416,667 Fully Paid Ordinary Shares, payable on execution of the Term Sheet;
- the following securities, payable at settlement of the Acquisition:
  - 22,916,667 Fully Paid Ordinary Shares;
  - 15,000,000 unlisted options at an exercise price of \$0.30 and expiry of four years from the date of issue;
  - 12,500,000 performance shares which vest into ordinary shares on a 1:1 basis, subject to satisfaction of the following milestones:
    - **Milestone 1:** 6,250,000 performance shares which vest upon the granting of three additional key exploration licences out of the four priority licences selected E08/3078, E08/3086, E52/3701 and E47/3971; and
    - **Milestone 2:** 6,250,000 performance shares which vest upon the announcement of an Inferred (or higher categorisation) Mineral Resource in accordance with JORC 2012 Edition Guidelines (or other globally recognised mineral code) of a minimum of 3 million tonnes at >55% iron; and
- 2% Net Smelter Royalty on all future metals obtained from the Tenements.

Settlement of the Acquisition is subject to satisfaction of the following conditions precedent, which must be satisfied on or before 30 December 2019 (or such other date as agreed in writing by the parties):

- TAO obtaining all necessary shareholder and regulatory approvals to implement the Acquisition, including but not limited to approval under Listing Rule 11.1.2;
- completion of TAO’s proposed \$2.5m capital raising;
- TAO completing legal, financial and technical due diligence on DSO and the Projects;
- all necessary ministerial and third party consents are obtained for the transfer of the granted tenements to DSO;
- all necessary ministerial and third party consents are obtained for TAO, DSO and the Vendors to enter into power of attorneys and trust deeds for each tenement which is in application phase, appointing DSO and TAO power of attorney in respect of all decisions to be made on

the tenements and confirming that the tenement applications are held on trust for the benefit of DSO and TAO, with effect from the date of settlement of the Acquisition;

During the Option period and prior to Settlement, TAO will set an exploration and maintenance budget for the Tenements and will reimburse DSO and the Vendors (as applicable) in respect of any costs incurred by DSO and the Vendors in maintaining the Tenements and progressing the Tenement applications in accordance with the budget approved by TAO, upon grant of the application Tenements..

Subject to the completion of the Acquisition, GTT Ventures Pty Ltd will be paid the following consideration for GTT's services in facilitating the Acquisition:

- 2,291,667 Fully Paid Ordinary Shares;
- 3,000,000 unlisted options at an exercise price of \$0.30 and expiry of four years from the date of issue;
- 1,250,000 performance shares which vest into ordinary shares on a 1:1 basis, subject to satisfaction of the following milestones:
  - 625,000 performance shares which vest upon the satisfaction of Milestone 1 described above; and
  - 625,000 performance shares which vest upon the satisfaction of Milestone 21 described above.

TAO intends to convene a shareholder meeting in due course to seek the approvals described above.

**END**

### **Competent Persons Statement**

The information in this announcement that relates to Exploration Results and other technical information complies with the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the **JORC Code**) and has been compiled and assessed under the supervision of Ms Felicity Repacholi-Muir, an independent consultant to the Company. Ms Felicity Repacholi-Muir is a Member of the Australian Institute of Geoscientists. She has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Ms Repacholi-Muir consents to the inclusion in this announcement of that matters based on her information in the form and context in which it appears. The Exploration Results are based on standard industry practices for drilling, surveying, logging, samplings, assay methods including quality assurance and quality control measures as detailed in Table 1 and Table 2.

## Tom Price- JORC Code, 2012 Edition – Table 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<p><b>Rock Chip Sampling:</b> Selective rock chip samples of outcropping hematite mineralisation were taken in order to gain an understanding towards the tenor and impurities associated with the iron mineralisation.</p> <p><b>RC Drilling:</b> Rio Tinto completed 56 RC holes for 3,003m of drilling between 1982-2018. Composite samples ranged between 1.5 and 2m. Sample weights averaged 4kg. This primary sample was split into a 2kg sub sample.</p> <p>API Management completed 11 RC drill holes for 360m of drilling completed. 2m composite samples were taken. Three bulk samples of 10kg was collected. Samples were riffle split and the sample weights were not reported.</p>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<p><b>Rock Chip Sampling:</b> The rock chip samples taken were selective in nature. Field duplicate sampling of the hematite material was taken to confirm the reproducibility of results.</p> <p><b>RC Drilling:</b> Rio Tinto and API Management utilised a rigorous QAQC process involving field duplicates and lab resplits to ensure reproducibility of the results and identify any potential sample biases.</p>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<p><b>Rock Chip Sampling:</b> A 2-3kg rock chip sample was taken. Samples were submitted to SGS. SGS crushed the material to nominal 6mm and pulverized the crushed sample to nominal 85% passing 75µm. Samples were analysed via XRF fusion.</p> <p><b>RC Drilling:</b> Rio Tinto and API both submitted RC chip samples to SGS. SGS crushed the material to nominal 6mm and pulverized the crushed sample to nominal 85% passing 75µm. Samples were analysed via XRF fusion.</p>
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	RC drilling was completed using a 5 ½ inch face sampling bit.
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	Sample weights were recorded by Rio Tinto. Poor recovery intervals were logged by both Rio Tinto and API Management.

Criteria	JORC Code explanation	Comments
Location of data points	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	<p><b>Rock Chip Sampling:</b> Location of rock chip samples was determined using a handheld GPS. The samples were for the purpose of reconnaissance and were not intended to be utilised in a Mineral Resource estimation.</p> <p><b>RC Drilling:</b> Rio Tinto and API Management utilised licenced surveyors to identify the location of drill collars. API Management holes were only surveyed at collar as they were vertical. Rio Tinto utilised a gyroscopic tool for downhole surveys. The location and survey methods are suitable for utilisation in a Mineral Resource estimation.</p>
	<ul style="list-style-type: none"> <li>Specification of the grid system used.</li> </ul>	MGA94 Zone 50
	<ul style="list-style-type: none"> <li>Quality and adequacy of topographic control.</li> </ul>	<p><b>Rock Chip Sampling:</b> Hand held GPS was utilised for recording elevation. The accuracy is sufficient for reconnaissance purposes.</p> <p><b>RC Drilling:</b> DGPS surveying was utilised to record the elevation of drill collars. This is considered to be industry best practices.</p>
Data spacing and distribution	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> </ul>	Drilling across the CID target was completed on 180-250m section spacing with 50-75m spacing between drill holes on each section.
	<ul style="list-style-type: none"> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> </ul>	Further evaluation of the drilling is required to determine whether it is suitable to estimate a mineral resource.
	<ul style="list-style-type: none"> <li>Whether sample compositing has been applied.</li> </ul>	No sample compositing has been applied.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	The drilling completed is orientated to be perpendicular to the trend of mineralisation based on mapping and interpreted geological trends.
	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	The drilling intercepts reported are downhole. Based on the orientation of the drilling relative to the mineralised units it is interpreted that the intervals intersected approximate a true width of the mineralisation.
Sample security	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<p><b>Rock Chip Sampling:</b> Rock chip samples were taken by qualified field geologists, submitted to a courier and delivered directly to SGS laboratory.</p> <p><b>RC Drilling:</b> No records exist of the chain of custody of samples for Rio Tinto and API Management.</p>
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	None conducted

## Tom Price- Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> </ul>	E47/3971 is an exploration licence application. A 2% net smelter royalty applies to all metals sold from the licence.
	<ul style="list-style-type: none"> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	There are no known impediments towards the grant of the licence.
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	Exploration to date has been completed by Rio Tinto and API Management.
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<p>The project area is located along the south-dipping, northern limb of the Mount Turner Syncline. Here, rocks of the upper Fortescue Group, including laterally extensive dolerite sills, are overlain by the Hamersley Group. Most of the tenement straddles mafic volcanic rock and siliciclastic sedimentary rock of the Jeerinah Formation at the top of the Fortescue Group. These rocks are intruded by mafic sills which are part of the Fortescue Group. In the northwest and northeast corners of the tenement, rocks of the underlying Bunjinah Formation outcrop. Along the southern margin of the western part of the tenement, rocks of the Marra Mamba Iron Formation are exposed over a strike length of more than 4 km. The eastern part of the tenement incorporates a portion of a river valley containing partly consolidated and cemented colluvium. Some of this colluvium was derived from strike ridges of Marra Mamba Iron Formation.</p> <p>Multiple mineralisation styles including CID, DID and Brockman Formation hematite mineralisation have been identified within the Project.</p>
Drill hole Information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> </ul>	All collar location, depth, azimuth and dip information are provided within Appendix 1 of this announcement.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	All available information has been included.
Data aggregation methods	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> </ul>	Length weighted averages are reported in the highlights and body of the announcement. A full listing of the individual intervals is reported in the body of the release above.
	<ul style="list-style-type: none"> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> </ul>	Length weighted averages have been applied where necessary to calculate composite intervals. Calculations were performed in excel using the sumproduct function to calculate the length weighted average grades.
	<ul style="list-style-type: none"> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	No metal equivalent values are being used for reporting exploration results.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	All intersections are reported as downhole lengths. Additional drill holes are required to confirm the relationship between downhole lengths and true widths.
Diagrams	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	Maps and plans have been included in body of the announcement.
Balanced reporting	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	All results including those with no significant results have been reported.

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	<p>· Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>No other exploration data is considered meaningful and material to this announcement.</p>
Further work	<p>· The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</p>	<p>Further field based mapping is proposed in order to understand the extent of the mineralisation present across the project and to prioritise drill targets.</p> <p>Geological modelling of the drilling to date is proposed to be undertaken to understand the requirement of further drilling in order to delineate a mineral resource.</p>
	<p>· Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>Diagrams illustrating the results of drilling have been included in the body of the release.</p> <p>Further releases will be made to the market upon devising a drill program for the Project.</p>

## West Pilbara CID Project - JORC Code, 2012 Edition – Table 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<p>Fortescue Metals Group Limited (Fortescue or FMG) completed drilling targeting CID mesas and buried CID within their Red Hill Project, which lies within the current Cane River Project. 17 RC drillholes were completed for a total of 252m.</p> <p>The Mt Stuart CID Project has been subject to two phases of iron ore drilling. Fortescue completed 24 reverse circulation holes for a total of 510m during 2016.</p>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<p>Each RC sample was crushed to 3.35 mm and sub-sampled with 150 g sub-sample used for standard XRF sample. Field duplicates and certified reference material (standard) samples were included in each head assay sample submission.</p>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<p>Exploration results are based on 1 m samples from reverse circulation (RC) drilling with an average sample size of 3–5 kg collected and sent to the Bureau Veritas (formerly Ultra Trace) laboratory for analysis.</p>
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<p>RC Drilling was completed using Schramm T685W drill rigs for a nominal drill hole diameter of 140 mm (5.5 inches) utilising a standard face sampling hammer bit.</p>
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	<p>Sample quality and recovery of both RC and diamond drilling was monitored during drilling to ensure that samples were representative and minimise sample quantity variations. A visual assessment of the RC sample quality was recorded for each 1 m interval.</p>
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	<p>RC drilling was carried out with the use of boosted high pressure air to maximise sample quality and quantity.</p>

Criteria	JORC Code explanation	Comments
	<ul style="list-style-type: none"> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<p>Rig duplicates are used to assess any sample bias which may results from rig sampling methods. Results of duplicate assays show some variation in elemental abundance between primary and duplicates samples, but the variability is random and no bias is evident.</p> <p>Sample recovery of the RC drilling is not quantitative and as such, no assessment can be made of the relationship between sample recovery and assay grade.</p>
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	Trained geologists with experience in iron ore and magnetite mineralisation were employed to perform the geological logging of RC chip samples.
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	Logging is both quantitative and qualitative with measurement of mineral and lithological abundances, as well as recording physical properties of grain size and shape, recovery, moisture level, and some general properties derived from rig performance (hard slow drilling, easy drilling, difficult sampling due to clay etc).
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	Geological logs are recorded for each 1m sample interval. All intervals are logged.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> </ul>	Not Applicable, no Core Drilling completed.
	<ul style="list-style-type: none"> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> </ul>	Two 3-5 kg RC drilling samples are collected via a rig-mounted cone splitter, equivalent to approximately 6-7% of the total sample for each 1 m interval.
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> </ul>	At the laboratory the samples are sorted, dried and weighed. They are crushed to 3.35 mm and a 150 g split is taken using a riffle splitter for standard XRF analysis.
	<ul style="list-style-type: none"> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul>	Samples were generally collected from the rig as dry samples, with minimal impact from ground water or drilling fluids.
	<ul style="list-style-type: none"> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> </ul>	Field duplicates were collected at the drill rig at a rate of approximately 1 field duplicate every 20 m, using the same techniques as the original samples. Results for the field duplicates shows acceptable precision for the main elements with no biases evident.
	<ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	No analysis of sample size has been conducted with respect to the particle size, however given the mineralisation style and grades, the samples sizes are considered appropriate.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	<p>All RC samples were assayed at either Ultra Trace or Bureau Veritas (with Ultra Trace doing the actual XRF analysis). Both laboratories are NATA accredited for ISO17025.</p> <p>Assaying is by fused bead XRF with a standard suite of iron ore elements reported. Sample assays after 2012 included an extended suite of elements. Loss-on-ignition (LOI) was determined by thermogravimetric analysis (TGA) and includes the total LOI and splits.</p> <p>The following elements have been assayed: Fe, SiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub>, P, MnO/Mn, MgO, CaO, TiO<sub>2</sub>, Na<sub>2</sub>O, S, K<sub>2</sub>O, As, Ba, Cl, Co, Cr, Cu, Ni, Pb, Sn, Sr, V, Zn, Zr,</p>

Criteria	JORC Code explanation	Comments
		FeO, Salmagolite/magnasol ( $\text{Fe}_3\text{O}_4$ ), and three LOI's at 371°C, 650°C, and 1000°C, plus total LOI.
	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> </ul>	No geophysical tools were used.
	<ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<p>A laboratory standard or FMG coarse reference standard is included for each sample batch (approximately 1 per 100 samples).</p> <p>Each laboratory carried out internal checks and sample assays, including the use of standards. Results for these standards and duplicates are statistically validated by both the laboratory and FMG as part of the QAQC procedures.</p>
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> </ul>	Significant intersections have not been independently verified. Drill logging is validated by site geologists against assay data and geophysical signals to verify intersections and interpretations. Senior geologists review the intersections and drilling in cross-section and 3D to verify targets and drilling effectiveness.
	<ul style="list-style-type: none"> <li>The use of twinned holes.</li> </ul>	No twinned holes were completed.
	<ul style="list-style-type: none"> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> </ul>	Data is logged into Toughbook's during drilling and then directly loaded into an AcQuire database to avoid transcription error.
	<ul style="list-style-type: none"> <li>Discuss any adjustment to assay data.</li> </ul>	No adjustments have been made to the data.
Location of data points	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	A contract surveyor (Down Under Surveys) was commissioned to pick up all drill collars to DGPS accuracy of $\pm 3\text{cm}$ Easting and Northing, and $\pm 5\text{cm}$ in elevation.
	<ul style="list-style-type: none"> <li>Specification of the grid system used.</li> </ul>	Coordinates are in Map Grid Australia format (MGA94) and heights are based on the Australian Height Datum (GDA94). The area lies within UTM Zone 50.
	<ul style="list-style-type: none"> <li>Quality and adequacy of topographic control.</li> </ul>	DGPS accuracy of $\pm 5\text{cm}$ in elevation.
Data spacing and distribution	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> </ul>	Drillhole spacing varies from 800m x 200m at Mt Stuart to 1.6km x 200m at Cane River
	<ul style="list-style-type: none"> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> </ul>	The level of drill spacing is sufficient for this style of mineralisation to establish the degree of geological and grade continuity to support Mineral Resource classification.
	<ul style="list-style-type: none"> <li>Whether sample compositing has been applied.</li> </ul>	No sample compositing has been applied.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	All RC drilling is vertical which is suitable given the flat lying nature of channel iron deposits.

Criteria	JORC Code explanation	Comments
	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<p>Due to the flat lying nature of channel iron deposits and the vertical drillholes there is no sampling bias evident.</p>
Sample security	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<p>Sampling and sample security is in accordance with FMG standard procedures. Samples are delivered from site to Linfox distribution Centre for dispatch to the assay laboratory, and samples are tracked during this process.</p> <p>Sample tracking is based on sample ID and this is monitored from drill site to laboratory via the Acquire database. Upon receipt of a sample dispatch at the laboratory, a sample quality check and inventory check are carried out and any missing or damaged samples is communicated, and this is then investigated and reconciled prior to sample processing.</p>
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	<p>No external audit of the sampling and assaying techniques has been carried out.</p>

## West Pilbara- Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Further work	<ul style="list-style-type: none"> <li>· The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>· Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<p>Further field-based mapping is proposed in order to understand the extent of the mineralisation present across the project and to prioritise drill targets.</p> <p>Geological modelling of the drilling to date is proposed to be undertaken to understand the requirement of further drilling in order to delineate a mineral resource.</p> <p>Diagrams illustrating the results of drilling have been included in the body of the release.</p> <p>Further releases will be made to the market upon devising a drill program for the Project.</p>

## Wiluna West JORC Code, 2012 Edition – Table 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	A total of 151 RC drill holes for 11,500m of drilling was completed.
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	Samples were collected using a cyclone splitter at 1m intervals.
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	Only documentation available referred to samples being collected using a cyclone splitter. One meter samples were collected in pre-numbered sample bags. The one meter samples were analysed for an iron ore suite of elements at Ultra Trace and SGS Laboratories in Perth. Samples were prepared using standard laboratory preparation method by Ultra Trace and SGS. Samples were analysed via Fused bead, X-ray fluorescence with gravimetric determination.
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	RC drilling was completed by a Schramm T46 and a T450 rig with 5 1/2 in and 5 3/4 inch sampling bit.
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	No sample weights or recoveries reported.
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	No records of measurements undertaken to maximise sample recovery.
	<ul style="list-style-type: none"> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	No bias between sample recovery and grade has been identified.
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	All RC drill holes were geologically logged for the total length of the hole. Logging records lithology, mineralogy, alteration, veining, structure, mineralisation and weathering. Drill logs were digitized from public open file reports and stored in a validated access database. The access database is further validated through importing into Micromine.

Criteria	JORC Code explanation	Comments
		The logging is appropriate and sufficiently detailed to support Mineral Resource estimates.
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	Logging of drill core is both qualitative and quantitative.
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	100% of the holes were logged inclusive of significant intercepts.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> </ul>	Not Applicable- No Core Drilling
	<ul style="list-style-type: none"> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> </ul>	Samples were collected using a cyclone splitter on 1m interval.
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> </ul>	Sample preparation was completed in accordance with SGS and Ultra Trace Laboratories standard operating procedure.
	<ul style="list-style-type: none"> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul>	Standard preparation procedure inclusive of internal laboratory internal crushing and pulverising QC tests were applied by SGS and Ultra Trace Laboratories.
	<ul style="list-style-type: none"> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> </ul>	Field duplicate samples were taken by GWR Group Ltd.
	<ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	The sample sizes are considered appropriate to the mineralisation style and the grain size of the material.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	Fused bead, X-ray fluorescence with gravimetric determination is considered industry standard. The methods are considered to be total digestion for the elements being analysed.
	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> </ul>	No geophysical tools were used.
	<ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	A combination of standards and duplicates were utilised by GWR Group Ltd in addition to the laboratory internal standards, blanks and duplicates.
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> </ul>	Assay results were compared to geological logging from exploration reports in order to validate the geological integrity of the reported intercepts.
	<ul style="list-style-type: none"> <li>The use of twinned holes.</li> </ul>	No twinned holes have been completed to date.

Criteria	JORC Code explanation	Comments
	<ul style="list-style-type: none"> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> </ul>	Exploration reports were reviewed and where required data was digitised. The data was validated and imported into an access database. Further validation was completed through the importing and validation in Micromine.
	<ul style="list-style-type: none"> <li>Discuss any adjustment to assay data.</li> </ul>	No adjustments have been made to the data.
Location of data points	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	DGPS surveying was undertaken to locate the drill collars. A combination of downhole wireline surveys and collar compass surveys were utilised.
	<ul style="list-style-type: none"> <li>Specification of the grid system used.</li> </ul>	MGA94 Zone 50
	<ul style="list-style-type: none"> <li>Quality and adequacy of topographic control.</li> </ul>	DGPS surveying was utilised to record the elevation for the majority of drill collars. This is considered to be industry best practices.  A proportion of the drill collars had a nominal elevation assigned.
Data spacing and distribution	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> </ul>	The drilling was completed on an irregular grid as part of the drilling undertaken was targeting gold mineralisation.
	<ul style="list-style-type: none"> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> </ul>	Further evaluation of the drilling is required to determine whether it is suitable to estimate a mineral resource.
	<ul style="list-style-type: none"> <li>Whether sample compositing has been applied.</li> </ul>	No sample compositing has been applied.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	The drilling completed is orientated to be perpendicular to the trend of mineralisation based on mapping and interpreted geological trends.
	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	The drilling intercepts reported are downhole. Based on the orientation of the drilling relative to the mineralised units it is interpreted that the intervals intersected approximate a true width of the mineralisation.
Sample security	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	No records exist of the chain of custody of samples.
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	None conducted

## Wiluna West- Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> </ul>	E52/2031 is a granted exploration licence. A 2% net smelter royalty applies to all metals sold from the licence.
	<ul style="list-style-type: none"> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	There is no known impediments towards the development of the Project.
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	The majority of exploration completed to date has been by GWR Group Ltd (Formerly named Golden West Resources Ltd)
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<p>The Project is located within the central extent of the Joyners Find Greenstone Belt, near the north-eastern margin of the Yilgarn Craton. The Joyners Find Greenstone Belt is a narrow (5-10km) north-south striking sequence of prominent ridges of banded iron formation ("BIF") intercalated with mafic and ultramafic schists containing minor chert and clastic sediment horizons.</p> <p>The majority of the lithological units within the Joyners Find Greenstone Belt are north to north-north-westerly trending, sub-vertical to steep westerly dipping. Folds developed within the D2 deformation event are observed in the BIF ridges as tight to isoclinal structure orientated north-south with west dipping axial planes. The BIF ridges are variably deformed and intensely folded.</p> <p>Hematite mineralisation occurs within two main BIF ridges, surrounded by interbedded mafic and ultramafic units. Mineralised horizons appear to be controlled by structural deformation.</p>
Drill hole Information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> </ul>	All collar location, depth, azimuth and dip information is provided within Appendices of this announcement.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	All available information has been included.
Data aggregation methods	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> </ul>	Length weighted averages are reported in the highlights and body of the announcement. A full listing of the individual intervals is reported in the body of the release above.
	<ul style="list-style-type: none"> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> </ul>	Length weighted averages have been applied where necessary to calculate composite intervals. 	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	Logging of drill core is both qualitative and quantitative.
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	100% of the holes were logged inclusive of significant intercepts.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> </ul>	Not Applicable - No Core Drilling completed.
	<ul style="list-style-type: none"> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> </ul>	Samples were collected using a cyclone splitter on 1m interval.
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> </ul>	Sample preparation was completed in accordance with ALS standard operating procedure.
	<ul style="list-style-type: none"> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul>	Standard preparation procedure inclusive of internal laboratory internal crushing and pulverising QC tests were applied by ALS.
	<ul style="list-style-type: none"> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> </ul>	Field duplicate samples were submitted for analysis.
	<ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	The sample sizes are considered appropriate to the mineralisation style and the grain size of the material.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	X-ray fluorescence with gravimetric determination is considered industry standard. The methods are considered to be total digestion for the elements being analysed.
	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> </ul>	No geophysical tools were used.
	<ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	Quality control checks included blank samples (quartz gravels), field duplicates and nine different certified material standards from Geostats.

Criteria	JORC Code explanation	Comments
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> </ul>	Assay results were compared to geological logging from exploration reports in order to validate the geological integrity of the reported intercepts.
	<ul style="list-style-type: none"> <li>The use of twinned holes.</li> </ul>	No twinned holes have been completed to date.
	<ul style="list-style-type: none"> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> </ul>	Exploration reports were reviewed and where required data was digitised. The data was validated and imported into an access database. Further validation was completed through the importing and validation in Micromine.
	<ul style="list-style-type: none"> <li>Discuss any adjustment to assay data.</li> </ul>	No adjustments have been made to the data.
Location of data points	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	A hand held gps was utilised to locate the drill collars. Downhole gyroscopic surveying was completed.
	<ul style="list-style-type: none"> <li>Specification of the grid system used.</li> </ul>	MGA94 Zone 50
	<ul style="list-style-type: none"> <li>Quality and adequacy of topographic control.</li> </ul>	A handheld GPS was utilised to determine the elevation.
Data spacing and distribution	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> </ul>	The drilling was completed on an irregular grid due to topographical constraints.
	<ul style="list-style-type: none"> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> </ul>	Further evaluation of the drilling is required to determine whether it is suitable to estimate a mineral resource.
	<ul style="list-style-type: none"> <li>Whether sample compositing has been applied.</li> </ul>	No sample compositing has been applied.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	The drilling completed does not reflect the true width of interpreted mineralisation due to the topographic constraints and geometry of mineralisation precluding the ability to drill perpendicular to mineralisation.
	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	The drilling intercepts reported are downhole. The drilling completed is oblique to the mineralisation and further work is required to determine the true width of mineralisation.
Sample security	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	Samples were bagged into polyweave bags then transported via the Horseshoe Range Camp by the camp manager to Meekatharra and then via Toll Ipec to ALS Perth. Batches of samples were submitted daily at Horseshoe Range and bulker bags delivered to Toll Ipec Meekatharra on approximately a weekly basis.
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	None conducted

## Mt Padbury- Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> </ul>	E52/3701 is a granted exploration licence. A 2% net smelter royalty applies to all metals sold from the licence.
	<ul style="list-style-type: none"> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	There are no known impediments towards the development of the Project.
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	Iron exploration undertaken has been completed by Austsino Resources Ltd (Formerly named Padbury Mining Ltd)
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<p>The Mt Padbury Project is located within the Padbury Basin, comprised of Palaeoproterozoic sedimentary and mafic volcanic lithologies deposited in a foreland basin setting. Lithologies have been deformed in a fold and thrust belt during the Capricorn Orogeny arising from the collision of the Archean Pilbara and Yilgam Cratons.</p> <p>Four major compressional and deformational events which have resulted in complex folding, faulting and shearing of the basin sediments and volcanic rocks.</p> <p>The Padbury Group of lithologies comprises of the following four stratigraphic units, Labouchere and Wilthorpe, Robinson Range and Millidie Creek Formations. Locally these formations unconformably overlie the Horseshoe Formation of the Bryah Group, but in places are in faulted contact with the underlying Bryah Group or Archaean gneiss of the Narryer Terrane.</p> <p>Mapping completed by the Geological Survey of Western Australia ("GSWA") has delineated several iron-rich regolith units within the Peak Hill region. Units include remnants of the extensive lateritic cover developed over the region in humid sub-tropical conditions during the Cainozoic. Quaternary iron rich colluvium and alluvium units have also been mapped.</p>
Drill hole Information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>eastings and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> </ul>	All collar location, depth, azimuth and dip information is provided within Appendices of this announcement.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	All available information has been included.
Data aggregation methods	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> </ul>	Length weighted averages are reported in the highlights and body of the announcement. A full listing of the individual intervals is reported in the body of the release above.
	<ul style="list-style-type: none"> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> </ul>	Length weighted averages have been applied where necessary to calculate composite intervals. Calculations were performed in excel using the sumproduct function to calculate the length weighted average grades.
	<ul style="list-style-type: none"> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	No metal equivalent values are being used for reporting exploration results.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	All intersections are reported as downhole lengths. Additional drill holes are required to confirm the relationship between downhole lengths and true widths.
Diagrams	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	Maps and plans have been included in body of the announcement.
Balanced reporting	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	All results including those with no significant results have been reported.

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	No other exploration data is considered meaningful and material to this announcement.
Further work	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> </ul>	Geological modelling of the drilling is required to be completed in order to determine what work is required to delineate a mineral resource.
	<ul style="list-style-type: none"> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	Diagrams illustrating the results of drilling have been included in the body of the release.  Further releases will be made to the market upon devising a drill program for the Project.
