Independent consultant confirms three IOCG and two Mt Isa style mineralisation targets

- An independent geology consultant has reviewed >15,000 assay values across >3,000 historic data locations and reaffirmed there are three IOCG & two Mt Isa style mineralisation targets within the Mt Oxide pillar
- Of the eight prospects currently in focus within the Mt Oxide pillar (refer Appendix A), the mineralisation styles are summarised below:
 - ❖ Three IOCG: Arya, Crescent, & Flapjack
 - ❖ Two Mt Isa style: Pancake, & The Wall
 - ❖ Two Supergene / Oxide ore: Big One Deposit & Boomerang Mine
 - ❖ Shear-hosted copper: Johnnies
- There is potential for these prospects to deliver high-grade, near surface deposits suitable for open-pit operations that each feed into an onsite or third-party processing facility
- Further, given the depth of historic data available, preliminary test-drill targets have been defined for most of the prospects under review
- Over the next few weeks, a drilled-down analysis on each prospect – starting with The Wall – will be released to highlight the upside potential ahead of commencing the inaugural drilling campaigns
- Prospect in focus: The Wall (Mt Isa style), in the northern quadrant, has an anomalous zone (400m by 225m) with soil samples that assayed up to **7,163ppm Zn, 2,023ppm Pb and 1,464ppm Cu¹** coincident with an aerial GEOTEM conductor

Castillo Copper's Managing Director Simon Paull commented: "Ongoing work by CCZ's independent geology consultant has reaffirmed the Mt Oxide pillar has several scalable IOCG and Mt Isa style mineralisation targets. Encouragingly, the vast quantum of data uncovered has enabled preliminary walk-up drill targets to be identified for most of the eight prospects currently in focus."

Castillo Copper's London-based Director Gerrard Hall remarked: "The story out of the Mt Oxide pillar continues to impress, with excellent news on IOCG potential and prospects with drill-test ready targets. Encouragingly, this new evidence continues to reinforce the Mt Oxide pillar delivers multiple targets with upside potential."

Castillo Copper Limited (“CCZ”) is pleased to announce its independent geology consultant has re-affirmed there are IOCG and Mt Isa style mineralisation targets within the Mt Oxide pillar, after reviewing >15,000 assay values across >3,000 historic data points.¹

Currently, the independent geology consultant is focusing on eight prospects (refer Appendix A), with varying mineralisation styles (Figure 1). Notably, the prospects have the potential to deliver high-grade, near surface deposits suitable for multiple satellite open-pit operations with each feeding into an onsite or third-party processing facility.

Further, due to the significant amount of historic data available preliminary test-drill targets for most of the prospects have been defined.

As there is a substantial amount of information to report across the eight targets, over the next few weeks a drilled down analysis on each will be released, starting with The Wall prospect.

| FIGURE 1: MINERALISATION SUMMARY FOR THE MT OXIDE PILLAR PROSPECTS | |
|--|--|
| The Wall | Mt Isa style mineralisation |
| Pancake | Mt Isa style mineralisation |
| Johnnies | Shear-hosted copper |
| Crescent | IOCG target |
| Flapjack | IOCG target |
| Arya | Sizeable massive sulphide anomaly with IOCG potential |
| Big One Deposit | Shallow high-grade supergene ore up to 28.4% Cu from drilling intercepts |
| Boomerang Mine | Historically produced 4,211t high-grade oxide ore grading circa 6% Cu |

THE WALL: MT ISA STYLE MINERALISATION POTENTIAL

Historic geological investigations at The Wall prospect comprised aerial GEOTEM and ground geophysical surveys plus comprehensive stream sediment, soil and rock-chip sampling campaigns (refer Appendix B).

Assays results verified The Wall prospect exhibits Mt Isa style mineralisation potential as surface readings for zinc-lead-copper were within an anomalous soil sample zone: dimensions circa 400m by 225m. The best soil sample assayed results were up to **7,163ppm Zn, 2,023ppm Pb, 1,464ppm Cu**.

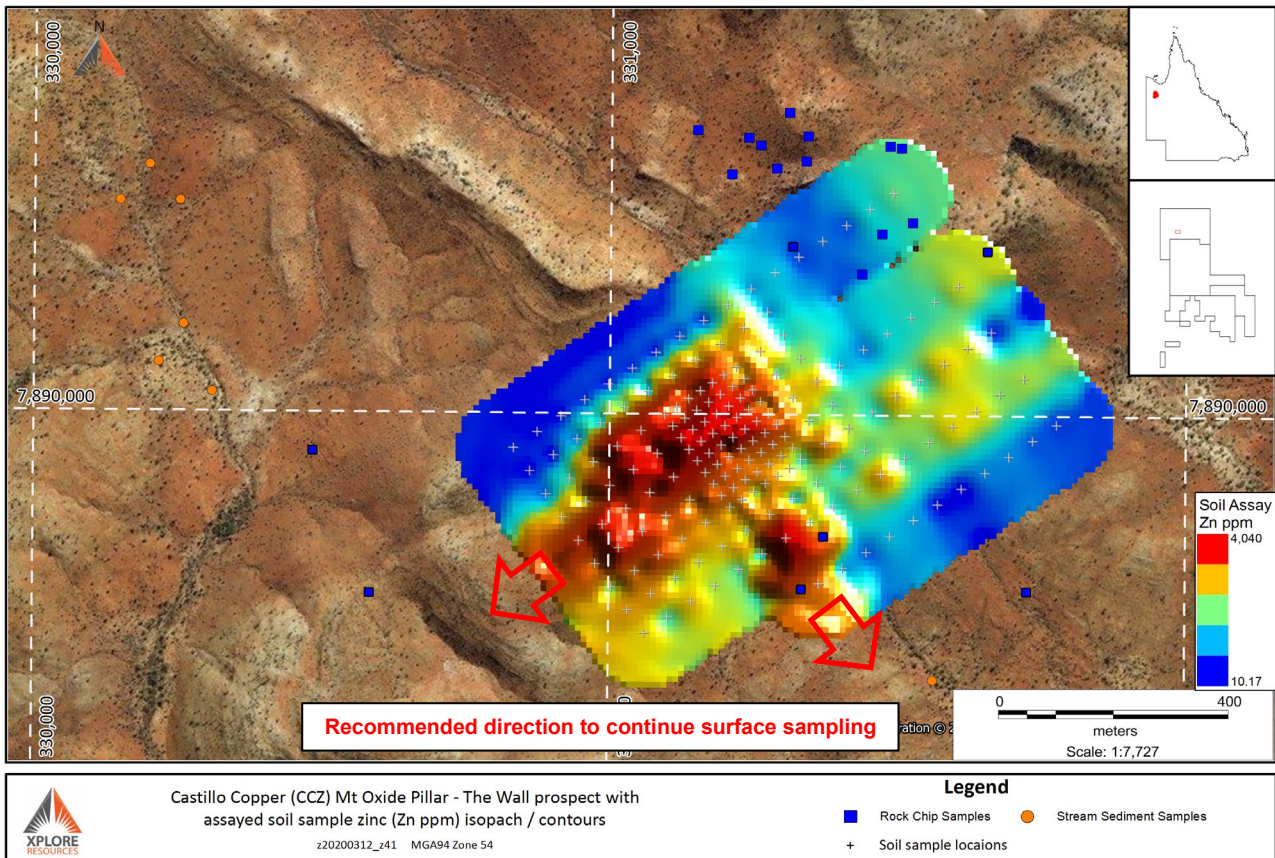

Adjacent to the anomalous soil zone, to the north, a circa 300m diameter rock chip cluster produced assayed values that ranged up to **3,700ppm Zn, 806ppm Pb and 373ppm Cu¹**.

Interpretation

The independent geology consultant believes there is potential to extend the anomalous surface mineralisation to the north, south-west and south-east through selective re-sampling. Interestingly, using modern GIS tools to display the assay data has shown an additional anomalous area of assayed rock chip samples that are currently adjacent to but separate to the soil sample grid. Moreover, for the prospect as a whole, utilising modern exploration techniques would provide a greater understanding of the sub-surface geology and provide incremental targets. However, the immediate priority test-drill is the GEOTEM anomaly coincident with high zinc surface values.

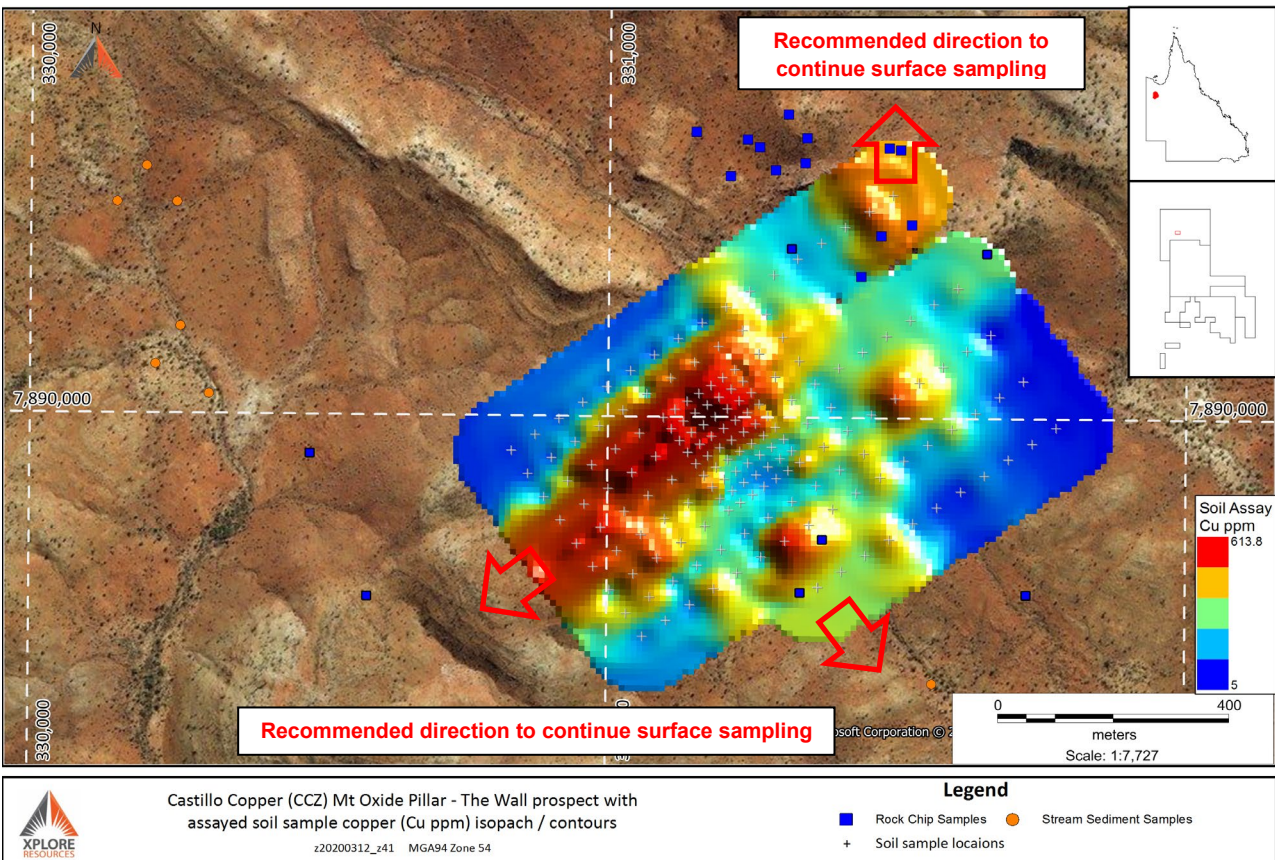

Figure 1-3 below are Isopach contour maps for The Wall prospect comprising zinc-copper-lead readings which highlight the concentration of surface mineralisation.

Next steps

Drilled down analysis pending on remaining prospects within the Mt Oxide pillar that have not yet been covered in depth and finalising preliminary drill targets.

An update on the recent soil sampling campaign at the Luanshya project (Zambia pillar).

For and on behalf of Castillo Copper

Simon Paull

Managing Director

ABOUT CASTILLO COPPER

Castillo Copper Limited (ASX: CCZ) is a base metal explorer primarily focused on copper then zinc & nickel.

The group is embarking on a strategic transformation to morph into a mid-tier copper group underpinned by three core pillars:

- **Pillar I:** The Mt Oxide project in the Mt Isa copper-belt district, north-west Queensland, which delivers significant exploration upside through having several high-grade targets and a sizeable untested anomaly within its boundaries in a copper-rich region.
- **Pillar II:** Four high-quality prospective assets across Zambia's copper-belt which is the second largest copper producer in Africa.
- **Pillar III:** Cangai Copper Mine in northern New South Wales, which is one of Australia's highest grading historic copper mines.

In addition, Castillo Copper is progressing a dual listing on the Standard Board of the London Stock Exchange.

Competent Person Statement

The information in this report that relates to Exploration Results for the Mt Oxide pillar contained in this announcement is based on a fair and accurate representation of the publicly available information at the time of compiling the ASX Release, and is based on information and supporting documentation compiled by Nicholas Ryan, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Nicholas Ryan is an employee of Xplore Resources Pty Ltd. Mr Ryan has been a Member of the Australian Institute of Mining and Metallurgy for 14 years and is a Chartered Professional (Geology). Mr Ryan is employed by Xplore Resources Pty Ltd. Mr Ryan has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Ryan consents to the inclusion in the report of the matters based on his information and the form and context in which it appears.

The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

APPENDIX C: JORC Code, 2012 Edition – Table 1 – M.I.M. Exploration Pty Ltd Surface Sampling Summary

Primary source of information and data are QDEX reports, the five (5) QDEX reports that were reviewed for this ASX Release and the accompanying JORC Code (2012) Table 1 are:

- 1) M.I.M Exploration Pty Ltd, 1998. Exploration Permit for Minerals No. 7804 “Fiery Creek” Queensland. Final Report. QDEX Report number: 30006.
- 2) M.I.M Exploration Pty Ltd, 1996. Exploration Permit for Minerals No. 7676 “Pandanus Creek”, Queensland. Final Report. QDEX Report number: 27982.
- 3) M.I.M Exploration Pty Ltd, 1994. Exploration Permit for Minerals Nos. 7676 “Pandanus Creek”, and 7804 “Fiery Creek”. Annual Report for the 12 months ended February 25, 1994. QDEX Report number: 25492.
- 4) M.I.M Exploration Pty Ltd, 1993. Exploration Permit for Minerals Nos. 7676 “Pandanus Creek”, and 7804 “Fiery Creek”. Annual Report for the 12 months ended February 25, 1993. QDEX Report number: 24522.
- 5) M.I.M Exploration Pty Ltd, 1993. Exploration Permit for Minerals Nos. 7448 “Lagoon Creek”. Second Annual Report 18 May 1991 to 17 May 1992, Queensland Australia. QDEX Report number: 24523.

Section 1 Sampling Techniques and Data

| Criteria | JORC Code explanation | Commentary |
|----------------------------|---|---|
| Sampling techniques | <ul style="list-style-type: none"> <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i> | <ul style="list-style-type: none"> Three (3) surface sampling methods were described in the current ASX Release, these are: <ul style="list-style-type: none"> Soil Samples – for The Wall, samples were initially taken on a 100m by 50m grid, in some portions the grid pattern was tightened to 25m by 25m controlled by either DGPS navigation or set out using a Theodolite. Samples were collected in the minus 80# fraction and analysed for a standard suite of elements. Stream Sediment Samples – were collected from practically accessible locations, across active sections of the stream/drainage channels gravel beds. Sieving the field to - 2mm fraction was conducted to obtain a ~2kg sample of stream sediment material. Rock Chip Samples – were collected from approximately a 3m radius around the recorded co-ordinate location. The rock chip fragments that were collected to make up the sample included fragments that approximately ranged from 2-5cm. Sub-sampling occurred as described in the section ‘Sub-sampling techniques and sample preparation’ in Section 1 of the current Table 1. |

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| | | <ul style="list-style-type: none"> The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |
| Drilling techniques | <ul style="list-style-type: none"> Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). | <ul style="list-style-type: none"> Not Applicable – no Drilling results are discussed in this ASX Release. |
| Drill sample recovery | <ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | <ul style="list-style-type: none"> Not Applicable – no Drilling results are discussed in this ASX Release. |
| Logging | <ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. | <ul style="list-style-type: none"> The records for rock chip sampling are shown in the Appendices of each relevant report where brief descriptions of the lithology etc is recorded within sample ledgers/registers. The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. | <ul style="list-style-type: none"> Sub-sampling occurred in the field for soil samples where a 2kg sample was taken for analysis. The recovered samples for soil, stream and costeans were predominantly dry. The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |

| Criteria | JORC Code explanation | Commentary |
|---|---|---|
| Quality of assay data and laboratory tests | <ul style="list-style-type: none"> <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> | <ul style="list-style-type: none"> Drainage samples were collected, where practical, from active gravel beds across the section of the stream. Sieving in the field to – 2mm was carried out and approximately 2kg of material was submitted to Analabs Townsville for analysis. The samples were then dried and sieved to -80# and a small aliquot was then taken and analysed for base metals by method GA 140. This method comprises of a mix acid digest with AAS (Atomic Absorption Spectroscopic) finish. Elements analysed by this method were Cu, Pb, Zn, Fe, Mn, Co, Ag, Ni, Mo and Cd. Not all batched, however, were analysed for all elements. Gold was assessed by sampling techniques in the field then assayed by method GI 142 which is a cyanidation technique (BCL or Bulk Cyanide Leach) bottle roll which had detection limits as low as 0.05 ppb Au. Rock chips were collected by taking a series of chips approximately 2 to 5cm in diameter across approx. a 3m radius of the outcrop being sampled. The sample was then crushed and analysed for a base metal suite by method GA 140. Rock chips analysed for gold were done by suite GG 326 comprising of a 30 gram charged fire assay fusion with carbon rod finish with detection limits down to 0.001 ppm Au. Some indicator element and whole rock analysis was undertaken by ICP-MS at Analabs. The surface sample results described in this ASX Release are suitable for the reporting ‘exploration results’ for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. The Analabs analytical methods changed from March 1994, yet the same collection method appears to be comparable to earlier years: March 1994 – Jan 1996 (cr_27982) Analabs Assay methods employed for rock chip, soil, and stream sediment were: <ul style="list-style-type: none"> Method GI 142 (ICP) for elements Cu, Pb, Zn, Fe, Mn, Co, P, & As; Method GX401 (pressed powder XRF trace determination) for Ba; and Method GG334 (aqua regia with carbon rod finish) for Au. Detection limits across any year were suitable for detecting ‘Trace Elements’. ‘Ore grade’ testing occurred when either, visible base metal minerals were present and/or were Cu, Pb, or Zn, exceeded 10,000ppm of the respective element. The surface sample results described in this ASX Release are suitable for |

| Criteria | JORC Code explanation | Commentary | | | | | | |
|--|---|--|-----------------------------|--------------|---------------|---------|---------|-----------|
| | | the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. | | | | | | |
| Verification of sampling and assaying | <ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. | <ul style="list-style-type: none"> Independent verification of surface samples had been completed for gold assay values only. Analabs Townsville Assays checked against ALS Townsville Assays when high Au values were returned for stream sediment samples. The two sets of assay results showed an acceptable correlation. | | | | | | |
| Location of data points | <ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. | <ul style="list-style-type: none"> The Wall soil samples were initially taken on a 100m by 50m grid, in some portions the grid pattern was tightened to 25m by 25m controlled by either DGPS navigation or set out using a Theodolite. For rock chip samples, and stream sediment samples, positions were recorded by GPS with areas highlighting anomalies sometimes returned to for additional sampling and locations checked by GPS. Locational Data was recorded in local grid and/or AMG84 zone 54 Easting (mE) and Northing (mN). There was no topographical control used for locations. The points used to represent the newly identified mineral occurrence locations in the current ASX Release are approximate markers and should not therefore be considered the full extent and breadth of the newly identified mineral occurrences. The co-ordinates presented are as follows: <table border="1"> <thead> <tr> <th>Mineral Occurrence/Prospect</th><th>Easting (m)*</th><th>Northing (m)*</th></tr> </thead> <tbody> <tr> <td>Pancake</td><td>333,275</td><td>7,893,790</td></tr> </tbody> </table> <p>Notes: * co-ordinates are in MGA 94 Zone 54</p> <ul style="list-style-type: none"> Surface sample and assay data had been prepared and compiled into MapINFO 2019 (64 bit – Release Build 58: 12345.67), any translation of co-ordinate data utilised the Discover package, an add on to MapINFO. | Mineral Occurrence/Prospect | Easting (m)* | Northing (m)* | Pancake | 333,275 | 7,893,790 |
| Mineral Occurrence/Prospect | Easting (m)* | Northing (m)* | | | | | | |
| Pancake | 333,275 | 7,893,790 | | | | | | |
| Data spacing and distribution | <ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. | <ul style="list-style-type: none"> The Wall Soil samples initially covered a grid that approximated 100m by 50m, which was refined in locations to 25m by 25m. The soil sample data spacing is considered appropriate for defining grade and trend of the base metal assay values for Zn, Pb, & Cu. The Wall rock chip and stream sediment samples were taken at areas of interest and not confined by gridding. | | | | | | |

| Criteria | JORC Code explanation | Commentary |
|--|--|---|
| | <ul style="list-style-type: none"> <i>Whether sample compositing has been applied.</i> | <ul style="list-style-type: none"> There was no sample compositing applied to surface samples collected for The Wall. The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |
| Orientation of data in relation to geological structure | <ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> | <ul style="list-style-type: none"> For 'The Wall' rock chips and stream sediment samples, there was no fixed orientation as these methods were used in the first instance to define distinct areas of anomalies. For soil samples at specific localities, the grid was often oriented to cover the approximate trend of the anomaly(s) highlighted from earlier regional soil sampling and/or rock chip sampling. The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |
| Sample security | <ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> | <ul style="list-style-type: none"> There is no record of sample security methods were employed in the field or by transport to the laboratory and measures taken in the laboratory by earlier explorers. Given the provenance of the data from a large mining entity and the remoteness of the location, historical sample security is deemed adequate for the reporting of surface assay grades and trends. The surface sample results described in this ASX Release are suitable for the reporting 'exploration results' for mineral prospectivity, additional exploration work would have to be completed in order to geologically model and then estimate a mineral resource. |
| Audits or reviews | <ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> | <ul style="list-style-type: none"> To date there are no known external audits or review reports completed of the sample techniques and resultant data generated from the historical research of earlier explorers' records. |

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
|--|--|--|
| Mineral tenement and land tenure status | <ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | <ul style="list-style-type: none"> The following mineral tenures are held 100% by subsidiaries of Castillo Copper Limited, totalling an area of approximately 961km² in the “Mt Oxide project”: <ul style="list-style-type: none"> EPM 26574 (Valprasia North) – encompasses the Big One historical mineral resource, Holder Total Minerals Pty Ltd, Granted 12-June-2018 for a 5 year period over 100 sub-blocks (323.3Km²), Expires 11-June-2023. EPM 26462 (Big Oxide North) – encompasses the ‘Boomerang’ historical mine and the ‘Big One’ historical mine, Holder: QLD Commodities Pty Ltd, Granted: 29-Aug-2017 for a 5 year period over 67 sub-blocks (216.5Km²), Expires: 28-Aug-2022. EPM 26525 (Hill of Grace) – encompasses the Arya significant aeromagnetic anomaly, Holder: Total Minerals Pty Ltd for a 5 year period over 38 sub-blocks (128.8Km²), Granted: 12-June-2018, Expires: 11-June-2023. EPM 26513 (Torpedo Creek/Alpha Project) – Granted 13-Aug-2018 for a 5-year period over 23 sub-blocks (74.2Km²), Expires 12-Aug-2023; and EPMA 27440 (The Wall) – An application lodged on the 12-Dec-2019 over 70 sub-blocks (~215Km²) by Castillo Copper Limited. |
| Exploration done by other parties | <ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. | <ul style="list-style-type: none"> A selection of historical QDEX / mineral exploration reports have been reviewed for historical tenures that cover or partially cover the Project Area in this announcement. Federal and State Government reports supplement the historical mineral exploration reporting (QDEX open file exploration records). Most explorers were searching for Cu-Au-U and/or Pb-Zn-Ag, and in particular, proving satellite deposit style extensions to the several small sub-economic copper deposits (e.g. Big Oxide and Josephine). With the Mt Oxide Project in regional proximity to Mt Isa and numerous historical and active mines, the Project area has seen portions of the historical mineral tenure subject to various styles of surface sampling, with selected locations typically targeted by shallow drilling (Total hole depth is typically less than 50m). The Mt Oxide project tenure package has a significant opportunity to be reviewed and explored by modern exploration methods in a coherent |

| | | <p>package of EPM's, with three of these forming a contiguous tenure package.</p> <ul style="list-style-type: none"> • The five (5) historical exploration reports generated by MIM that contributed information and data to this ASX Release are detailed in the Appendix C preamble to the JORC 2012 Code Table 1. • Various Holders and related parties of the 'Big One' historical mining tenure (ML8451) completed a range of mining activities and exploration activities on what is now the 'Big One' prospect for EPM 26462. The following unpublished work is acknowledged (and previously shown in the reference list): <ul style="list-style-type: none"> ○ West Australian Metals NL, 1994. Drill Programme at the "Big One" Copper Deposit, North Queensland for West Australian Metals NL. ○ Wilson, D., 2011. 'Big One' Copper Mine Lease 5481 Memorandum – dated 7 May 2011. ○ Wilson, D., 2015. 'Big One' Mining Lease Memorandum – dated 25 May 2015: and ○ Csar, M, 1996. Big One & Mt Storm Copper Deposits. Unpublished field report. |
| Geology | <ul style="list-style-type: none"> • <i>Deposit type, geological setting and style of mineralisation.</i> | <ul style="list-style-type: none"> • The Mt Oxide North project is located within the Mt Isa Inlier of western Queensland, a large exposed section of Proterozoic (2.5 billion to 540 million year old) crustal rocks. The inlier records a long history of tectonic evolution, now thought to be similar to that of the Broken Hill Block in western New South Wales. • The Mt Oxide project lies within the Mt Oxide Domain, straddling the Lawn Hill Platform and Leichhardt River Fault Trough. The geology of the tenement is principally comprised of rocks of the Surprise Creek and Quilalar Formations which include feldspathic quartzites, conglomerates, arkosic grits, shales, siltstones and minor dolomites and limestones. • The Project area is cut by a major fault zone, trending north- northeast – south- southwest across the permits. This fault is associated with major folding, forming a number of tight syncline- anticline structures along its length. • The Desktop studies commissioned by CCZ on the granted mineral tenures described four main styles of mineralisation account for the majority of mineral resources within the rocks of the Mt Isa Province (after Withnall & Cranfield, 2013). |

| Criteria | JORC Code explanation | Commentary |
|----------|-----------------------|---|
| | | <ul style="list-style-type: none"> ○ Sediment hosted silver-lead-zinc – occurs mainly within fine-grained sedimentary rocks of the Isa Super basin within the Western Fold Belt. Deposits include Black Star (Mount Isa Pb-Zn), Century, George Fisher North, George Fisher South (Hilton) and Lady Loretta deposits; • Brecciated sediment hosted copper – occurs dominantly within the Leichhardt, Calvert and Isa Super basin of the Western Fold Belt, hosted in brecciated dolomitic, carbonaceous and pyritic sediments or brecciated rocks proximal to major fault/shear zones. Includes the Mount Isa copper orebodies and the Esperanza/Mammoth mineralisation. ○ Iron-oxide-copper-gold (“IOCG”) – predominantly chalcopyrite-pyrite magnetite/hematite mineralisation within high grade metamorphic rocks of the Eastern Fold Belt. Deposits of this style include Ernest Henry, Osborne and Selwyn; and ○ Broken Hill type silver-lead-zinc – occur within the high-grade metamorphic rocks of the Eastern Fold Belt. Cannington is the major example, but several smaller currently sub-economic deposits are known. <ul style="list-style-type: none"> • Gold is primarily found associated with copper within the IOCG deposits of the Eastern Fold Belt. However, a significant exception is noted at Tick Hill where high grade gold mineralisation was produced, between 1991 and 1995 by Carpentaria Gold Pty Ltd, some 700 000 tonnes of ore was mined at an average grade of 22.5 g/t Au, producing 15 900 kg Au. The Tick Hill deposit style is poorly understood (Withnall & Cranfield, 2013). • Rom Resources had noted in a series of recent reports for CCZ on the granted tenures, that cover the known mineralisation styles including: <ul style="list-style-type: none"> ○ Stratabound copper mineralisation within ferruginous sandstones and siltstones of the Surprise Creek Formation. ○ Disseminated copper associated with trachyte dykes. ○ Copper-rich iron stones (possible IOCG) in E-W fault zones; and ○ possible Mississippi Valley Type (“MVT”) stockwork sulphide mineralisation carrying anomalous copper-lead-zinc and silver. • The Mt Oxide and Mt Gordon occurrences are thought to be breccia and replacement zones with interconnecting faults. The Mt Gordon/Mammoth deposit is hosted by brittle quartzites, and Esperanza by carbonaceous shales. Mineralisation has been related to the Isan Orogeny (1,590 – 1,500 Ma). • Mineralisation at all deposits is primarily chalcopyrite-pyrite-chalcocite, typically as massive sulphide within breccias. |

| | | <ul style="list-style-type: none"> • At the Big One prospect, West Australian Metals NL described the mineralisation as (as sourced from the document “West Australian Metals NL, 1994. Drill Programme at the “Big One” Copper Deposit, North Queensland for West Australian Metals NL.”): <ul style="list-style-type: none"> ○ The targeted lode / mineralised dyke is observable on the surface. The mineralisation targeted in the 1993 drilling programme is a supergene copper mineralisation that includes malachite, azurite, cuprite, and tenorite, all associated with a NE trending fault (062° to 242°) that is intruded by a porphyry dyke. ○ The mineralised porphyry dyke is vertical to near vertical (85°), with the ‘true width’ dimensions reaching up to 7m at surface. ○ At least 600m in strike length, with strong Malachite staining observed along the entire strike length, with historical open pits having targeted approximately 200m of this strike. Exact depth of mining below the original ground surface is not clear in the historical documents, given the pits are not battered it is anticipated that excavations have reached 5m to 10m beneath the original ground surface. ○ Associated with the porphyry dyke are zones of fractured and/or sheared rock, the siltstones are described as brecciated, and sandstones around the shear as carbonaceous. ○ The known mineralisation from the exploration activities to date had identified shallow supergene mineralisation, with a few drillholes targeting deeper mineralisation in and around the 200m of strike historical open ○ A strongly altered hanging wall that contained malachite and cuprite nodules. Chalcocite mineralization has been identified but it is unclear on the prevalence of the Chalcocite; and ○ The mineralisation was amenable to high grade open pit mining methods of the oxide mineralization (as indicated by numerous historical open pit shallow workings into the shear zone). • Desktop studies commissioned by CCZ and completed by ROM Resources and SRK Exploration have determined that the Big One prospect is prospective for Cuco, and Ag. • Desktop studies commissioned by CCZ have determined the Boomerang prospect contains: <ul style="list-style-type: none"> ○ Secondary copper staining over ~800m of strike length. ○ Associated with a major east-west trending fault that |
