

Release of shares from voluntary escrow

Vulcan Energy Resources Ltd wishes to advise, in accordance with ASX Listing Rule 3.10A, the following securities will be released from voluntary escrow today:

- 300,000 fully paid ordinary shares

Highlights

Aiming to be the world's first
Zero Carbon Lithium™
producer.

Large, lithium-rich
geothermal brine project, in
the Upper Rhine Valley of
Germany.

Europe's **largest** JORC-
compliant lithium resource.

Located at the heart of the
EU Li-ion battery industry.

MoU agreement with German
geothermal operator at a
producing power plant.

Fast-track development of
project under way towards
production.

Vulcan Energie Ressourcen
GmbH
Baischstr. 8, 76133 Karlsruhe

Who Are We?

We're a mixture of Australian entrepreneurial spirit, German engineering excellence and a dash of North American tech brains. We have a strong background in the lithium space.

We're aiming to decarbonize the currently high carbon production footprint of lithium-ion batteries used in electric vehicles.

We plan to produce a world-first **Zero Carbon Lithium™** hydroxide product from our Vulcan geothermal lithium brine project.

It is the largest lithium resourceⁱ in Europe and located in the heart of the EU.

We will use our proprietary **Zero Carbon Lithium™** process, married with our unique and very large lithium resource, to pump up hot lithium-rich brine to the surface, then use the renewable heat to drive lithium extraction, with renewable energy as a saleable by-product.

We will **disrupt and lead** the resources industry towards a Zero Carbon future.

Figure 1: Schematic of the Zero Carbon Lithium™ process.

How Did We Get Here?

We started with a mission to create a Zero Carbon Lithium company.

We'd noticed European car manufacturers wanted to produce electric vehicles (EVs), with a zero-carbon production footprint:

"(Battery raw materials) sustainability as selection criteria on par with quality and price"

"Volkswagen's delivery promise: CO₂-neutral (EV) production including supply chain"

go TO zero

EVs are a great idea. They have no tailpipe emissions, are quicker, quieter, more efficient and over their lifetime much greener than fossil fuel cars.

The transition to EVs is happening quickly.

But because of all the metals that go into the lithium-ion battery, they currently take a lot of carbon to produce.

As much carbon by 2030 as the Netherlands emits, if we don't do something.

Successful companies are already trying to decarbonise:

6 DECEMBER 2019 **NEWS**

Alcoa-Rio Tinto JV sells first carbon-free aluminium to Apple

But there is no zero carbon or low carbon lithium, cobalt, nickel or graphite available for lithium-ion batteries^{ii iii iv}. **We can help fix that.**

We Searched for the Right Project

Lithium is mostly sourced from salty fluids on the surface called “continental brines”, but this takes a lot of energy and water to produce as they are not heated.

Hot, salty fluids deep in the sub-surface, called “geothermal brines”, produce renewable power and heat, and sometimes contain lithium.

We had the lithium expertise to know that Zero Carbon Lithium production was possible using modern extraction methods, provided a deep geothermal brine reservoir could be found that had the following geological conditions:

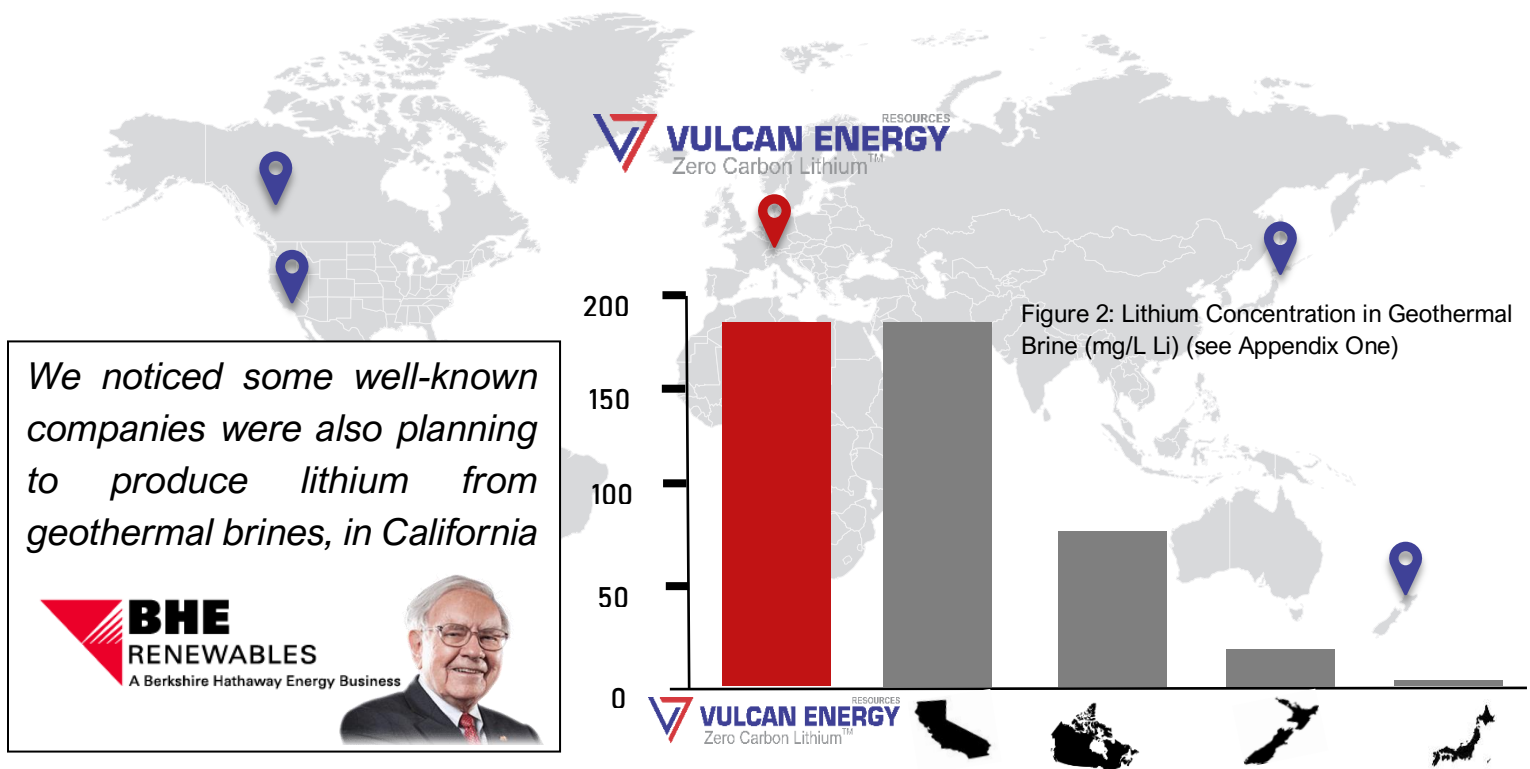

1. Renewable heat;
2. High lithium grades;
3. High brine flow rate.

We **scoured the globe** to find these conditions. Most geothermal brines don't have the required flow rate or lithium grade.

Our research showed that this could be done in just two places:

1. The Upper Rhine Valley in Germany, and 2. The Salton Sea in California^v.

We chose Germany and Europe, because we know it will be the fastest growing lithium market in the world in the 2020s, driven by EVs, and currently has zero domestic production of lithium hydroxide.

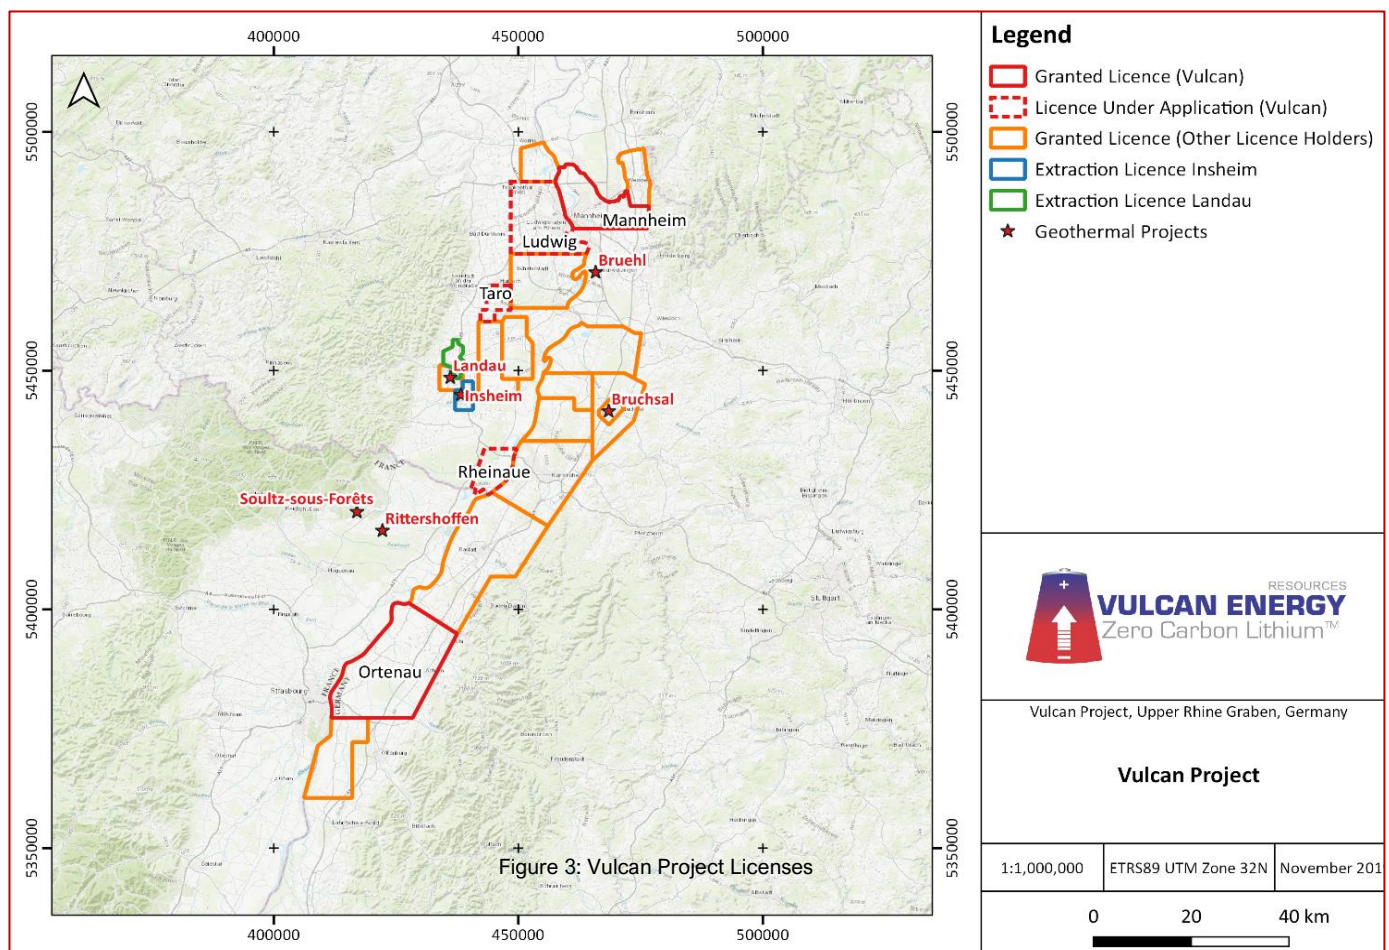

Birth of the Vulcan Project...

We used our geological expertise to pick out the best areas in the Upper Rhine Valley for sub-surface lithium grade and potential flow rate.

We secured exclusive rights to these areas: a very large license package hundreds of square kilometres in size.

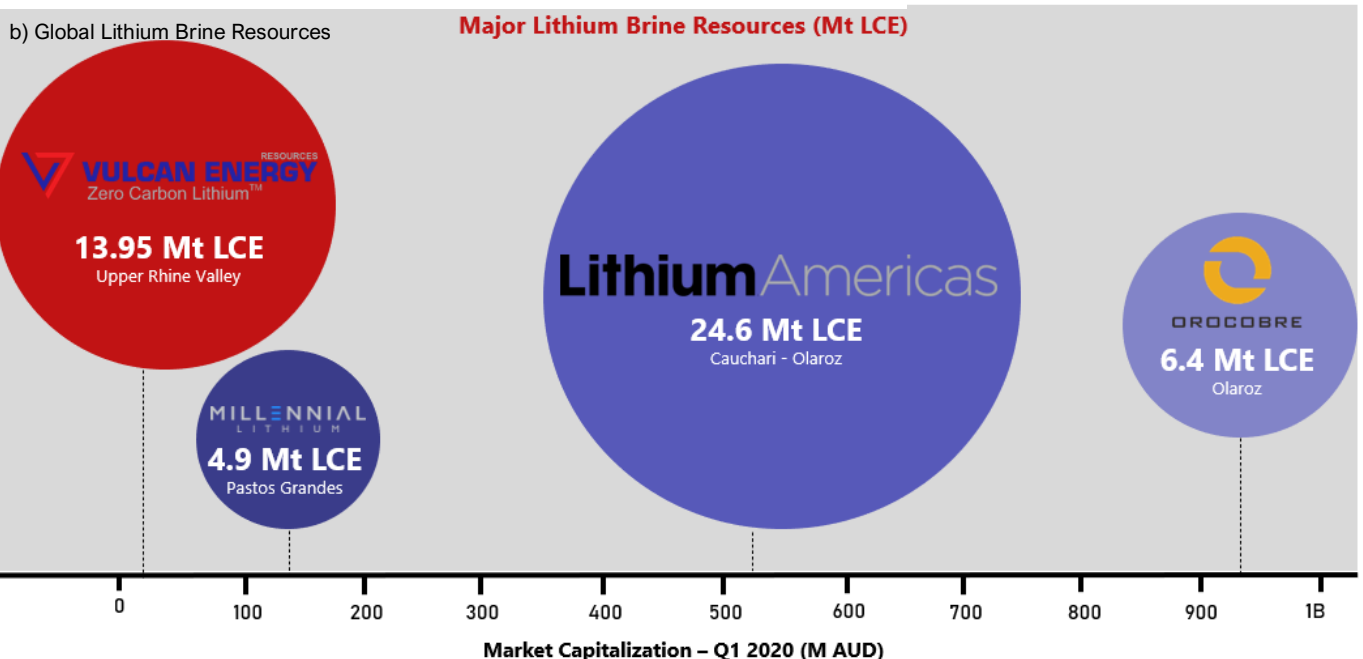

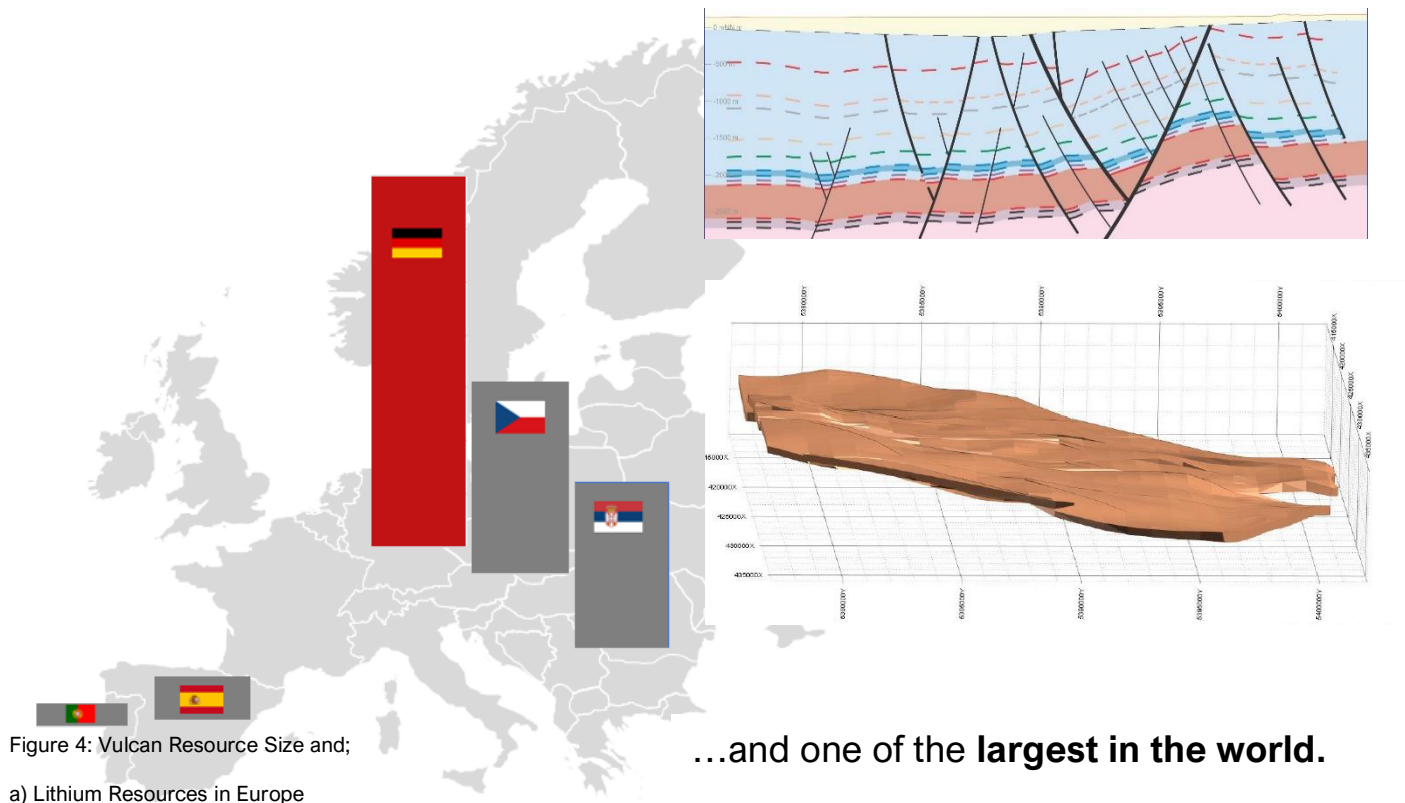

Underneath is the lithium, stored in the hot geothermal reservoir.

...and Growth to the Largest Resource in Europe

There's a treasure-trove of sub-surface data in the Upper Rhine Valley, including seismic and drilling data. Companies have been exploring for oil here for decades.

We gathered this data, generated our own data, analysed both, and defined the **largest lithium resource in Europe^{vi}** by far...

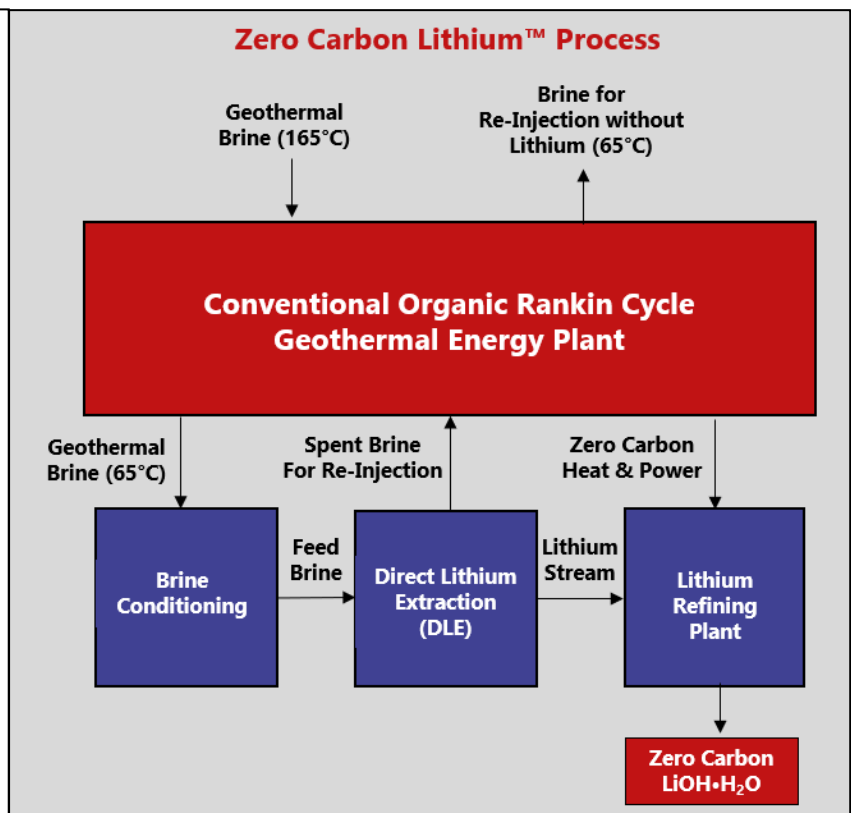

We Designed our Zero Carbon Lithium™ Process^{vii}

We will use **renewable heat** derived from the geothermal brine to drive the lithium extraction process, with **no fossil fuel consumption**.

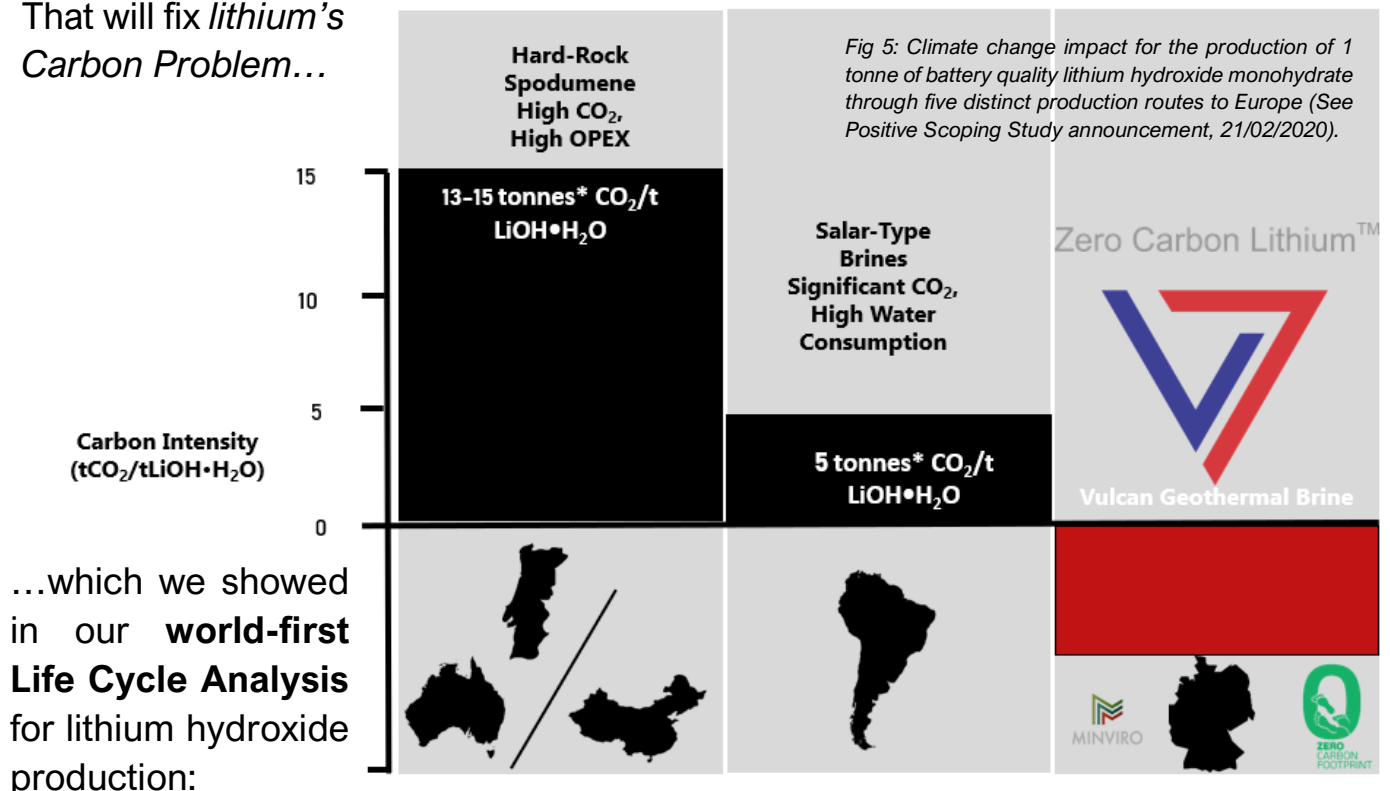

We will produce a surplus of renewable electricity, actually **decarbonising** the grid.

We will produce a unique, premium, battery-quality **Zero Carbon Lithium™** hydroxide product for EVs.

The spent brine then gets re-injected.

That will fix *lithium's Carbon Problem...*

No Evaporation, Mining or Fossil Fuels Required

Lithium extraction in South America evaporates large quantities of water in the second driest place on earth. This stresses the environment and local communities.

Europe doesn't want hard rock mines for lithium. Once you mine it, the rock has to be roasted with fossil fuels to produce lithium hydroxide. This is very CO₂-intensive.

And this is our solution: lithium from geothermal plants in the Upper Rhine Valley.

In harmony with the environment.

Lithium production from, and powered by, a renewable energy source: the **Zero Carbon Lithium™** process.

No evaporation, mining or fossil fuels required.

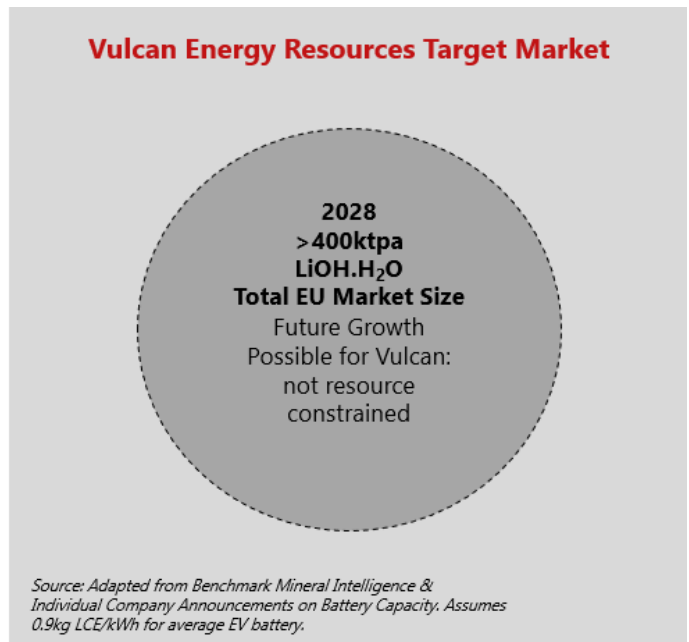

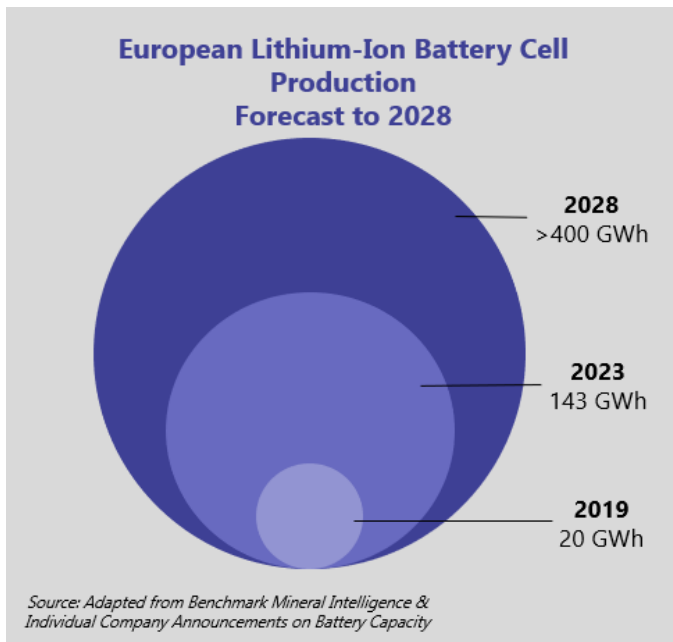

What's Our Target Market Like?

Europe is the world's fastest growing market^{viii} for lithium hydroxide, driven by a massive growth in production of lithium-ion batteries for EVs.

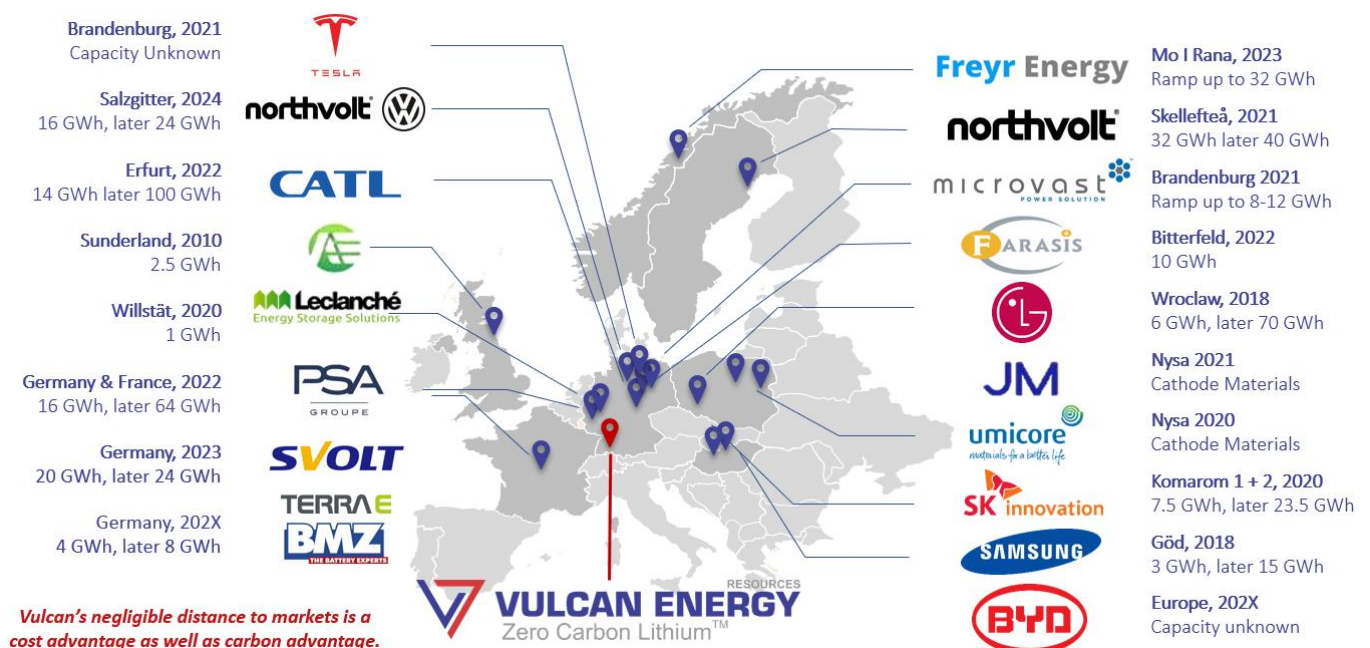

It needs more lithium hydroxide by 2028 than **the entire world consumes today**.

It has **zero local supply** of lithium hydroxide. 80% of global supply is from China.

Here's where we sit in relation to that market: at the very centre.

No high-carbon, high-cost transport from thousands of km away. Security of supply.

Cost: Advantage Geothermal Lithium Brine

If you're producing battery-quality lithium hydroxide chemicals, the price environment is strong. Lithium hydroxide is currently selling for around US\$13,000/t. It is widely tipped to rise even from here due to looming deficits.

LiOH Asia Weighted Average Price

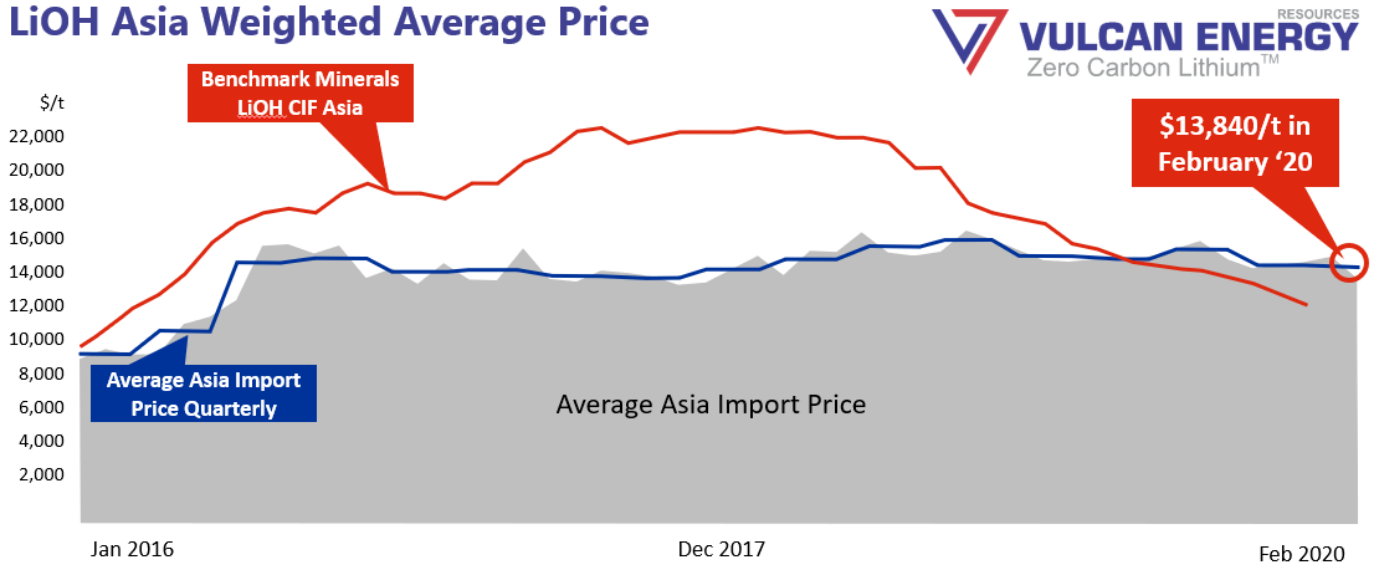

Fig 7: Weighted prices average from lithium hydroxide imports into Japan and South Korea from Chile, China, and the US. This represents 75% of the global LiOH trade and is mostly used in cathodes. Source: Infinity Lithium.

Brine projects are the lowest cost method of lithium hydroxide production, typically around US\$5-7,000/t (Source: Canaccord).

We have the added advantages of free heat to drive our process, short distance to market, a premium product, and most importantly, we also sell energy.

Germany has a fixed price of €0.25c/kWh for the renewable electricity we can produce. We plan to have **two revenue streams**: lithium and electricity.

They de-risk and complement each other.

Lithium Revenue

Energy Revenue

Where to From Here?

We just completed our **Scoping Study** in just six months, using our in-house team and world-renowned consultants. It was **highly positive**^{ix}.

Next, we'll be commencing our Pre-Feasibility Study (**PFS**).

We've just started bench-scale processing test work as part of this.

We'll then be constructing our own pilot plant to demonstrate and de-risk.

We expect to maintain our rapid momentum and get this done this year.

In 2021 we want to complete our Definitive Feasibility Study (**DFS**). We can take that to the bank.

We then plan a sensible scale-up, with our first, small commercial plant to be built at an existing geothermal operation, saving CAPEX: **Stage 1**.

Stage 2 will be much larger and would involve our own wells and geothermal plant construction.

We plan to grow with the European Electric Vehicle market in the 2020s.

We have a very large resource. If we want to produce more lithium, we can just drill more wells.

Local Partnerships^x

We have a Memorandum of Understanding (MoU) with a highly respected local geothermal plant operator.

This gives us access to live brine for processing test work.

It also contemplates us processing the plant's waste brine to product our first commercial Zero Carbon Lithium™ hydroxide, in a “win-win”.

This could potentially be a shortcut to commercial development.

A Note on Geothermal Lithium

Geothermal brines contain natural CO₂ in solution.

In Germany, this stays in solution and is re-injected. In some other parts of the world, this is de-pressurised and released to the atmosphere.

Not all geothermal lithium projects are the same.

Choose a Zero Carbon Lithium™ product.

A Note on our Process

We use Direct Lithium Extraction (DLE) as part of our overall flowsheet. It involves lithium extraction from brine without evaporation ponds.

The lithium industry is shifting to DLE processes, because:

1. Lithium extraction in hours instead of months.
2. Not weather-dependent like evaporation, in increasingly unstable climate.
3. Ability to produce consistent product for battery industry.
4. Spent brine water re-injected into reservoir with no evaporation losses.

This term has been used to describe a number of very different methods, at very different stages of development.

This ranges from bench-scale R&D, to full-scale commercial plants in South American and China.

We selected our preferred method using very strict criteria:

1. It must be commercially proven and already used on brines.
2. It must have a low CAPEX and OPEX.
3. It must be suitable for hot geothermal brines.
4. It must not involve solvents or reagents that could harm the environment.

Just like any resources project, we need to do processing test work to de-risk our geochemistry as we scale up.

We have strictly adhered to our policy of choosing process methods that are already commercially used on brines, which gives us confidence in our Zero Carbon Lithium™ flow sheet.

A Reminder of What Makes Us Special

World's 1st & Only Zero-Carbon Lithium™ Process.

A premium product and unique IP.

Zero Carbon Lithium™

Positive Scoping Study.

Global Experts. Robust basis for further work.

Dual Revenue Potential.

Lithium and geothermal energy revenue de-risks project.

Size & Quality: Europe's Largest Lithium Resource.

Not constrained by size, can grow with the market.

Location, Location, Location.

Centre of Europe, the world's fastest growing lithium market.

Local Partners & Infrastructure Access

Potential for fast track to production.

The Right Team for the Job

Lithium, geothermal and finance expertise.

Rapidly Advancing Lithium Project

With sensible path to growth.

For and on behalf of the Board
