

Market Update

MARKET EXPANSION IN VICTORIA AND INDONESIA

Computronics is licensed to market and sell an innovative range of facial identification and facial recognition technology developed by Vision Control International Pty Ltd (VCI) which has commercial application in security, law enforcement and card issuing organisations

The directors of Computronics are pleased to announce the expansion of facial recognition technology and its use in the domestic and International markets.

DOMESTIC

The use of algorithms to assist in facial imaging was developed by VCI and first implemented by the Victorian Police in the 1990s.

Victorian Police have been using enhanced facial recognition products since that date. Subsequent addition and installation of automated facial recognition and matching technology has resulted in reduced overheads and administrative tasks, and the dramatic reduction in the time taken to identify offenders and bring them to justice. The IFACE system is now used by 14,000 Victorian Police members with 26 automatic offender photo capture sites installed in the busiest precincts in the state.

The most recent development is the approval for Computronics to significantly expand the photo data base and provide an enhanced range of facial recognition features to service the camera capture points being installed in every new Police Station.

INTERNATIONAL

Computronics has negotiated a national re-seller agreement of its innovative range of personal identification products for the country of Indonesia, regulatory approval has been applied for and when the necessary Government consents are to hand further announcements will be made.

Computronics strategic plan is that the IFACE facial recognition will become the system of choice in the Asia-Pacific area, with over 170 ID units already in place in Malaysia, the appointment of a high-profile Indonesian company as the authorised reseller is a significant step towards our goal.

Yours faithfully
