Kalengwa Project Update

Re-logging of historical diamond drill holes and project desktop studies commenced

Integrated Resources Group Limited (ASX: **IRG**, “**IRG**”, “**the Company**”) wishes to announce that exploration on the Kalengwa projects has advanced with the commencement of re-logging of historical diamond drill cores from the Kalengwa South Copper project and a desktop study over both of the Kalengwa projects.

The flagship Kalengwa South project has previously been test drilled by major explorers Anglo, RST and Western Mining. Of the 436 holes drilled on the project in the past, 16 of these were diamond holes. IRG’s exploration team has travelled to the copperbelt to Kalulushi Core Farm where the diamond drill cores are stored to undertake the re-logging work. This work will allow the exploration team to get a feel of the lithologies and alteration assemblages associated with the mineralisation. This will help with defining our exploration strategy and more importantly drill targets as we move forward.

In addition to the re-logging, further desktop studies will be undertaken on historical data from both the Kalengwa South and East projects. There has never been a coordinated compilation of the historical data from these projects and it is intended that this process will not only identify new targets, but help us refine the prospects already identified at the Kalengwa South project, providing refined targets for drilling. It is hoped that the process will also identify targets for soil geochemical sampling at the Kalengwa East Project.

The re-logging and desktop studies are planned to be completed by the end of July. Following these studies, and upon receiving the decision letter from the Zambia environmental management agency, the Company will advance to the next phase of exploration.

Kind regards

On behalf of Integrated Resources Group Limited

Tim Moore
Chairman

Kalengwa Projects

The 'Kalengwa South' Project has been determined as the flagship project in the portfolio, located on Prospecting Licence 17212, with an area totalling 557km². The other three permits are contiguous and together comprise the 'Kalengwa East' project totalling 2,632km² (Prospecting Licences 18211, 17211 & 18162).

Historical drilling has been conducted on the Kalengwa South project and a significant database has been developed including over 300 shallow holes, 120 percussion holes, and 16 diamond holes which have identified four highly prospective targets. Refer to ASX announcement on 7 May 2014 for details of the project and JORC reporting. The Kalengwa East project is located in an area that is prospective for IOCG style mineralisation, similar to that of First Quantum's Kansanshi mine to the north. Several exploration targets have been identified from the regional magnetics.
