Alice Queen Limited (ASX:AQX) (“the Company” or “Alice Queen”) is pleased to announce further results as well as a progress update from its maiden drill program at the Ngurupai (Horn Island) Gold Project (“Ngurupai”).

Complete gold fire assays have now been received for 16NGD005, 16NGD006 and **16NGD007**. After a short break, holes 16NGD008 to 16NGD011 have now been completed with geological logging and core cutting underway. First assay results are expected in the coming weeks.

This initial drill program was originally planned over 14 holes for 3,000 metres and designed to confirm the presence of extensive gold mineralisation at Horn Island. To date 11 holes have been completed for 2672m, with hole 12 now underway. All drillholes to date have returned assay results confirming gold mineralisation with results also suggesting a large mineralised gold system open to the west and deepening.

PROGRAM HIGHLIGHTS:

- Program is confirming that vein Au mineralisation is extending to depth
- Mineralisation is open to the west outside the historical pit
- Geological observations suggest strongest quartz sulphide veining is appearing in holes 9 & 11 with intersections significantly widening
- Notable intersections from 5-7 inc:
 - 16NGD005 - 5.42g/t Au over 0.4m from 79.3m depth & 13.05g/t Au over 0.4m from 104.5m
 - 16NGD006 - 20.00 g/t Au over 0.3m from 56.9m depth
 - 16NGD007 - 4.42 g/t Au over 10.0m from 104m depth (inc 9.29g/t Au over 4.0m from 104m & 19.2g/t over 1m from 106m.
 - 3.63 g/t Au over 2.0m from 162.5m depth.
 - 1.84 g/t Au over 2.0m from 170m depth
 - 1.89 g/t Au over 2.0m from 190m depth
 - 1.75 g/t Au over 2.0m from 212.5m depth
 - 4.73 g/t Au over 0.4m from 217m depth
 - 7.4 g/t Au over 1m from 219.5m depth

Managing Director Andy Buxton commented, “We were very encouraged by the hole 7 results because they showed the gold veined mineralisation extends substantially to depth and is open westwards. Our subsequent holes 9 and 11 appear, based on geological observations, to be confirming this even more so, as they have intersected the strongest quartz-sulphide veining we have seen so far.”

John Holliday, Technical Director provided the following comments as to how the exploration model has evolved, “With the results of seven holes to hand and the geological observations from four subsequent holes (16NGD008 to 16NGD011 – see figure 1) available it is now possible to provide some information on the configuration of the Horn Island gold mineralisation. With all historic drill core and geological logs lost and most historic drilling only completed to 50m depth, these initial Alice Queen holes are revealing very significant new information on a large gold mineralised area.

The gold mineralisation is very clearly associated with zones of quartz-sulphide (galena, sphalerite, arsenopyrite) veining, mostly in granite. Holes 15NGD001 to 16NGD006 tested under the eastern part of the historic pit and to the south of the pit. These first 6 holes revealed the mineralised zones do not extend below a now identified basal fault (or faults) zone. In the most easterly hole (15NGD002) this fault was intersected at 80m depth down hole, however 280m to the west in 16NGD007 the probable same fault was intersected at 266m depth down hole. The above-fault wedge hosting gold mineralised veining is thus thickening substantially to the west and remains open in that direction. This also means that the gold mineralisation extends to at least 200-300m depth below the depth of mineralisation identified by the historic drilling, and that this extent is increasing westwards in the open direction.

Drilling subsequent to 16NGD007 has revealed the strongest and most consistent vein zones (based on geological observations, with assays not yet available) intersected to date. In 16NGD009 (see figure 1) two strongly veined zones have been intersected at 55m to 97m and 141m to 219m down hole. In 16NGD011 the same zones have been intersected at 60m to 116m down hole and 160m to 242m down hole. Based on these holes a trend of the strongest veined zones has been interpreted (as shown on figure 1).”

Hole Summary

Hole 16NGD007 tested the extent of the mineralised vein system to the northwest of the historic pit and 110m from 16NDG004, which had intersected 2.43g/t Au over 8.9m from 70.9m and 8.41g/t Au over 3.9m from 121.4m (see ASX release 25 February, 2016). A broad zone of mineralisation aligned

with the 16NGD004 zones was intersected from 92m depth, and other intervals of gold mineralisation were intersected throughout the hole to 220.5m. The hole was ended at 282.7m. The hole shows that the Au mineralised zone is thickening to depth. It also shows that the Au mineralisation is improving and is open westwards, outside of the historic pit area.

16NGD005 targeted historical surface workings, pits and shafts along the interpreted Ngurupai Reef running parallel to the southern part of the historic pit. The hole was drilled parallel to and 100m southeast of hole 16NGD003. Weakly altered and mineralised granites were intersected to 267m and the hole was ended at 395.9m.

Hole 16NGD006 tested the lateral extent of the mineralised vein system 100m to the southeast of hole 16NGD004. Two zones of mineralised veins were intersected at 51 and 74m down hole and the hole was ended at 349.1m. Visible gold was noted in the upper zone.

Table 1. Drill Hole Collar Data

Hole_ID	UTM Datum	UTM Zone	UTM Northing	UTM Easting	UTM Elevation	TN Azimuth	Dip	Length
16NGD005	GDA94	54	8826862	643790	19.8	45	-60	395.9
16NGD006	GDA94	54	8826918	643878	15.0	45	-60	349.1
16NGD007	GDA94	54	8827027	643687	52.0	45	-60	282.7

16NGD007	217	217.4	0.4	4.73
16NGD007	219.5	220.5	1	7.4

Notes:

- Reported intercepts are not true width. Insufficient data exists to calculate true widths.
- Table 2 reports uncomposited assays greater than 1 g/t Au. A complete table of all assays is contained in appendices.
- All assays exhibiting visible gold, or returning a fire assay >5 g/t will be repeated with Screen Fire Assay.
- These results are of a quality to be utilised in resource estimation.

Next Steps

Drilling recommenced on 15 March 2016 with the remaining drill holes in the program designed to test the westwards extent of mineralisation (see Figure 1).

The Company is pleased by the results achieved thus far which indicates a large mineralised Au system which is open to the west and deepening. Alice Queen will continue to provide further results from this maiden drill program over the coming weeks.

Competent Person Statement

The information in this report that relates to Exploration Results is based on information compiled by Mr John Holliday, a Competent Person who is a member of the Australian Institute of Geoscientists. Mr Holliday is a director of Alice Queen Ltd and Kauraru Gold Pty Ltd. Mr Holliday has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Holliday consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

JORC 2012 Edition, Table 1 Checklist

Sampling Techniques and Data

Criteria	Explanation
Sampling Techniques	Core sample intervals selected by geologist to honour lithology, alteration and mineralisation boundaries
	Overburden not sampled
	Sampling intervals are typically >10cm core length and <2.5m
	Samples are cut by core saw, with half core retained in core tray
	Cut line is 5mm to the right of the core orient line, bottom of core; with right side being sampled
	Cut core is sealed in plastic bags with unique id tag
	Approximately 3.5kg of sample per 1m of core
Drilling Techniques	Wireline diamond core drilling
	Atlas Copco CS14 track mounted drill rig operated by Eagle Drilling NQ Pty Ltd
	Oriented core with Reflex ACT instrument
	Core size HQ3 (Triple tube). Core diameter 61.1mm, hole diameter 95.6mm
	Steel casing placed and left in all holes, up to 9m
Drill Sample Recovery	Core recovery was measured from drillers run blocks.
	Poor recovery in overburden and strongly oxidised zones
	All intervals recovered > 80% discounting overburden
	All significant intervals grading >1g/t Au recovered >97%
Logging	Core measured for recovery and RQD by drill run, data entered into Access database
	Intervals of lost core assessed and assigned
	Intervening meter marks are labelled on core tray
	Core orient line marked from end of run and assessed against runs above and below
	Logged for lithology, structure, alteration and mineralisation
	Sample intervals assigned based on above parameters and given unique sample ids
	Sample intervals are generally >10cm and less than 2.5m
	QAQC samples inserted
	Two-part plastic sample id tag is stapled into core tray, half is removed and placed in sample bag once core is cut
	Core is photographed, wet, in shade with high megapixel camera
Sub-sampling techniques and	No sub-sampling or compositing has taken place
	Samples suspected to be mineralised are crushed to 70% passing 2mm sieve, ALS method CRU-31

ALICE QUEEN LIMITED

Sample Preparation	Samples suspected to be barren are crushed to 70% passing 6mm sieve, ALS method CRU-21
	Crushed samples are split to 1000g using rotary splitter
	1000g splits are pulverised to 85% passing 75um, ALS method PUL-32
	Pulverised splits are resplit to 50g aliquot for fusion and fire assay
	250g pulps are dissolved in Four Acid "near" Total digestion (HF-HNO ₃ -HClO ₄ -HBr) prior to multi-element ICP analysis
	Balance of pulps and coarse reject are retained in storage for further study
Quality of assay data and laboratory tests	Gold assay determined by Fire Assay with Atomic Absorption finish, ALS method AU-AA26
	Detection limits 0.01 - 100 g/t
	Overlimits gold assayed by dilution of aliquot and AU-AA26
	Presence of coarse gold is tested by Screen Fire Assay with AA finish (ALS Method SCRAA22) where initial Fire Assay is greater than 5 g/t Au, or visible gold is noted
	Silver analysis by 4 acid digest and Atomic Absorption (ALS Method Ag-OG62).
	All silver analyses >50 g/t by AA are repeated with fire assay
	All finalised assay certificates signed off by qualified assayer
	ALS Global Ltd is an ISO certified organisation with industry leading quality protocols
Verification of sampling and assaying	Client supplied Certified Reference Materials including three different gold grade standards and blank material were submitted within the sample stream
	Field duplicates were selected for second split after crushing stage
	30 QAQC samples were inserted into 396 samples for a total shipment of 426
	ALS internal CRMs and duplicates were also reported prior to release of finalised certificates
	No hole twinning has been undertaken
	No outside audit of results or procedures has been undertaken
	All logging and sampling undertaken under the supervision of a qualified geologist
Location of data points	Collars X and Y set with handheld GPS (+/-5m) and surveyed post-drilling with differential GPS (+/-2cm) using a base station on survey control points with 1km
	Z control taken from location on Digital Elevation Model derived from LiDAR data, Queensland State Government 2011 acquisition (+/-1m). Post-drilling with differential GPS (+/-2cm) using a base station on survey control points with 1km
	All locations using MGA94 UTM Zn 54 coordinates
	Down hole surveys completed during drilling with Reflex single shot magnetic camera, at 30m intervals
	Post-drilling holes downhole surveyed with north seeking gyroscopic camera at 10m intervals
Data spacing and distribution	Drillholes are continuously sampled from base of overburden to end of hole
	Sections are oriented 045 TN and approximately 100m apart.
	Collars are 100 - 200m spaced along section

ALICE QUEEN LIMITED

	Drill holes are inclined -50 to -60° from the horizontal
	This spacing is not adequate to result in a resource estimate
Orientation of data in relation to geologic structure	Drill azimuth of 045° is orthogonal to mapped strike of historical reefs worked
	Historical reefs dip -75 to 90° to the southwest while drillhole dips are -50 to -60° in the opposite direction (northeast)
	Hole dip is set for maximum drilling efficiency, depth and lateral reach
Sample Security	All samples selected and supervised by a qualified and experienced geologist
	All samples are sealed in plastic bags with cable ties immediately after cutting
	All samples are stored in a secure, permanently staffed facility prior to shipping
	Sample bags are loaded into polyweave sacks, and each sack is affixed a numbered, tamper-proof id tag which is cross checked upon receipt at destination
	Sacks are loaded into bulker bags for transport
	Bulker bags are sealed
	Shipments travel by ship from Ngurupai (Horn Island) to Cairns, then onshipped to ALS Minerals, Townsville by road
	Shipping us undertaken by reputable transport logistics specialists with freight security protocols
Audits or Reviews	No external or third party contractor has undertaken any audit or review of these procedures. These audits/reviews will be undertaken in course of future resource estimation

Reporting of Exploration Results

Criteria	Explanation
Mineral tenements and land tenure status	Kauraru Gold Ltd is the 100% undivided and unencumbered owner of EPM25520 covering the Nguruapi Project
	EPM 25520 is in good standing, with an expiry date of 7/10/2019
	Kauraru Gold Ltd is a joint venture company between Alice Queen Ltd and the Kaurareg Aboriginal Land Trust
	Surface title for portions of the historic Horn Island Mine site is held by the Torres Shire Council
	Other land areas above EPM25520 are held by the Kaurareg Aboriginal Land Trust
Exploration done by other parties	Nil

ALICE QUEEN LIMITED

Geology	Horn Island is located on the partly submerged Badu-Weymouth Belt (formerly Cape York – Oromio Ridge) of the Carboniferous-Permian Kennedy (Igneous) Province. The Badu- Weymouth Belt comprises felsic and intrusive igneous rocks of Upper Carboniferous age exposed on Cape York, the Torres Strait Islands and the southern shore of Papua New Guinea. The oldest Horn Island rocks are the Carboniferous Torres Strait Volcanics, which comprise welded tuff, ignimbrite and agglomerate, volcanic breccia and minor sediments.
	The Volcanics are intruded by the Late Carboniferous Badu Suite Granites, which are a series of high-level granites comprising a number of compositional and textural types – leucocratic biotite granite, porphyritic biotite granite and adamellite, and hornblende-biotite adamellite and granodiorite. Alluvial cover and laterite developed from Early Tertiary and Miocene time to the present.
	The Horn Island gold mineralisation has never been studied in great detail but summary descriptions based on limited information are provided by Levy and Storey, 1990 and von Gnielinski , 1996. The mineralisation occurs in quartz ± sulphide vein arrays/stockworks and breccias that are localised close to the contact of two Badu Suite intrusions (the Badu Granite and the Horn Island Granite) into various felsic welded tuffs (the Endeavour Strait Ignimbrite). The old mined zone is aligned NW to SE with the main historical old workings extending for at least 1500m over an area about 600m wide. Roughly half of this area is now under water in the open pit created in the 1980's. Geochemical information indicates gold is associated with base metal sulphides (galena especially). Alteration is mostly described as sericitic or propylitic.
Drill hole information	Collar locations and downhole survey information are located in tables appended
Data aggregation methods	No data aggregation or compositing of samples has taken place
	Subsequent intervals of similar assay grade may be aggregated by length weighting to report a longer composite in text statements, however the individual assays which make up these composites are presented in tables appended
	No top cutting of assays has been applied
	Zones of significance are defined as those greater than 1 g/t Au
	For display and statistical purposes, below detection limit assays are set to 10% of the detection limit, i.e >0.01 g/t is set to 0.001g/t
	Above detection limit assays, if no follow up method has determined a quantitative value, are reported as the upper detection limit
Relationship between mineralised widths and intercept lengths	Historical reefs dip -75 to 90° to the southwest while drillhole dips are -50 to -60° in the opposite direction (northeast)
	Insufficient structural information exists to calculate true widths of individual veins or mineralised zones. Infill drilling, and intercepts on an alternative drilling orientation will be required to calculate true widths

ALICE QUEEN LIMITED

Diagrams	Figures show plan and section views of drill holes
Balanced reporting	Assays are received for 15NGD001 through 16NGD007
	Assays are not received for holes 16NGD008 through 16NGD0011
	Reported assays are greater than 1 g/t Au, all other received assays are <1 g/t Au
Other substantive exploration work	No other exploration results which have not previously been reported, are material to this report
Further Work	11 drillholes are completed for a total of 3141m. A further 2 holes are planned
