RESULTS AND EXPLORATION UPDATE ON HORN ISLAND

Alice Queen Limited [ASX:AQX] (“the Company” or “Alice Queen”) is pleased to announce further results as well as a progress update from its maiden drill program at the Ngurupai (Horn Island) Gold Project (“Ngurupai”). This initial drill program was originally planned over 14 holes for 3,000 metres and designed to confirm the presence of extensive gold mineralisation at Horn Island.

13 holes for 3659.8m have been completed. Gold assays have now been received for all holes, and results for holes 16NGD008 to 16NGD013 are reported here. Drill holes to date have shown that gold mineralisation occurs with quartz-sulphide veins within a fault wedge of mainly granite. The mineralised fault wedge is open and deepening to the west.

HOLE 8 - 13 HIGHLIGHTS

- ✳ Program has confirmed that gold mineralisation extends westwards along strike and at depth below the historic open pit.
- ✳ Notable intersections from holes 16NGD008 to 16NGD013 include:
 - ✳ 16NGD008 - 9.24g/t Au over 0.5m from 175.0m
 - ✳ 16NGD009 - 7.19g/t Au over 0.7m from 33.6m and
 - 6.82g/t Au over 1m from 52.0m and
 - 0.94g/t over 12.9m from 69.3m
 - ✳ 16NGD011 - 1.94g/t over 9.5m from 83.7m including 10.35g/t Au over 0.9m from 85.5
 - ✳ 16NGD012 - 1.22g/t Au over 15.4m from 183.4m
 - ✳ 16NGD013 - 2.84g/t Au over 2m from 213.7m

Managing Director Andy Buxton commented “Our maiden drill program at Horn Island has largely achieved what it set out to do; that was to confirm the existence of a large, gold mineralised system underneath, and adjacent to, the old open pit. What is most encouraging is that this maiden program has also thrown up some exciting new geological data that may hold the key to unlocking the real potential of Horn Island. The Company intends to pursue these new ideas with vigour in a phase two program which will be announced to ASX in the coming weeks”.

ALICE QUEEN
LIMITED

ALICE QUEEN
LIMITED

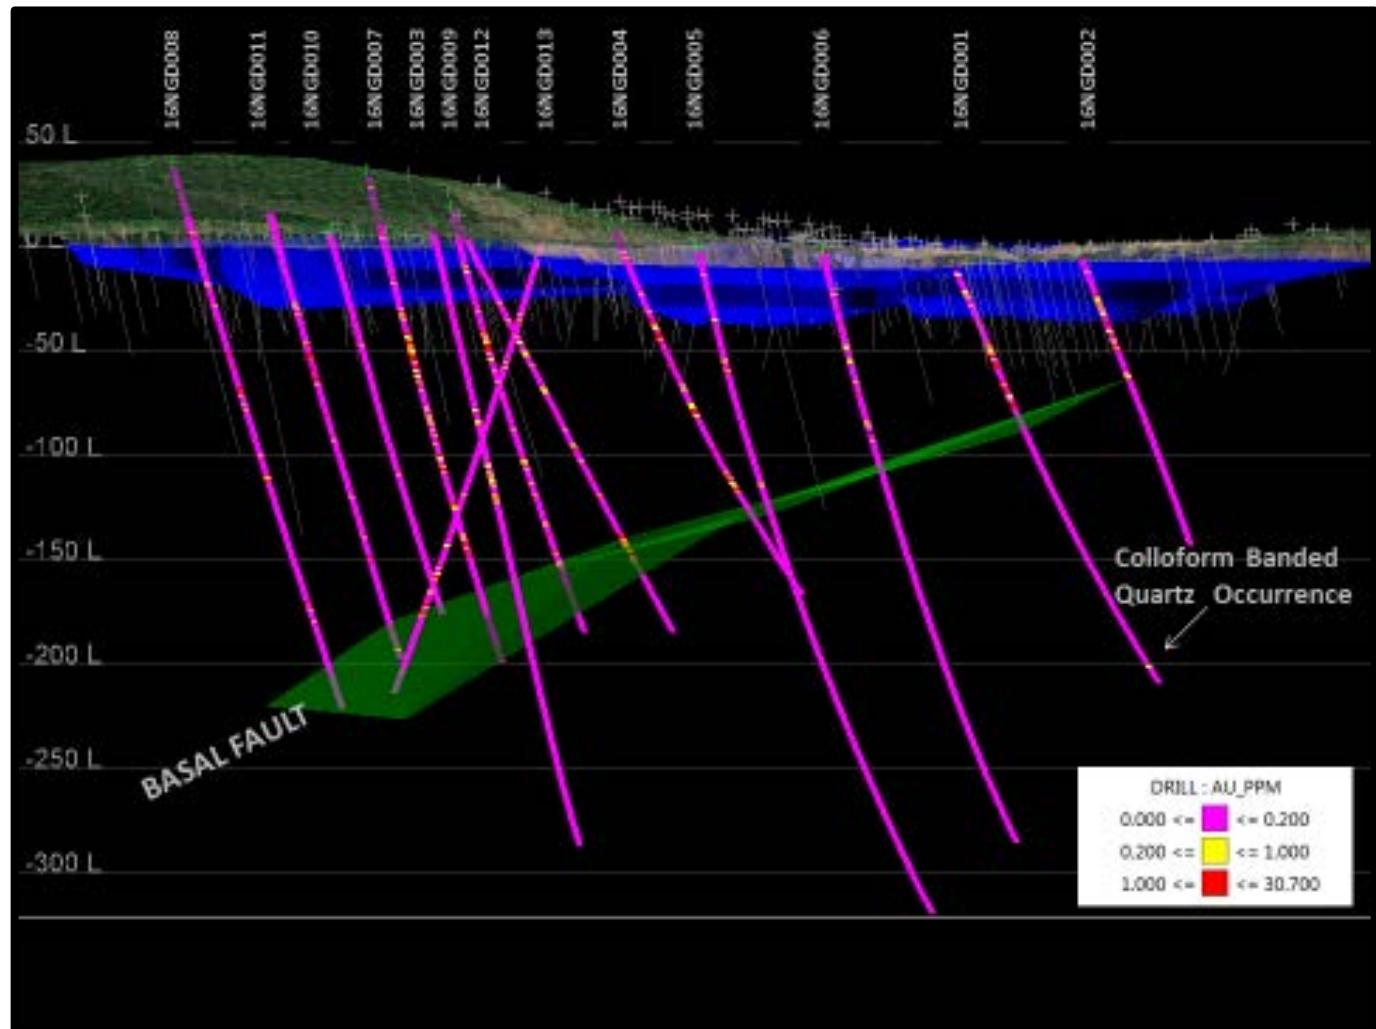

Figure 2. Isometric 3D view of all drilling current and historic (dashed) facing north

OCCURRENCE OF COLLOFORM BANDED QUARTZ FRAGMENTS.

A chalcedonic vein breccia intersected over 1.9m from 267m in hole 15NGD001 was observed to contain clasts of colloform quartz. This vein breccia returned a grade of 0.3 g/t Au and represents the deepest anomalous intercept to date. This intercept is well below the basal fault of the main mineralisation. It is being investigated to determine if it is a low sulphidation epithermal mineralising event distinct from the near surface sulphide-rich veins, which would then be an additional exploration target.

SURFACE SAMPLING

A program of reconnaissance surface sampling was undertaken in the open direction to the northwest of hole 16NGD008 in 10 traverses extending over 1km of interpreted strike length. Numerous outcrops, historic pits and trenches were examined, mapped and sampled. The results are presented in figure 5 below. The samples are selective grabs of visually mineralised material. Visible gold was observed in several samples.

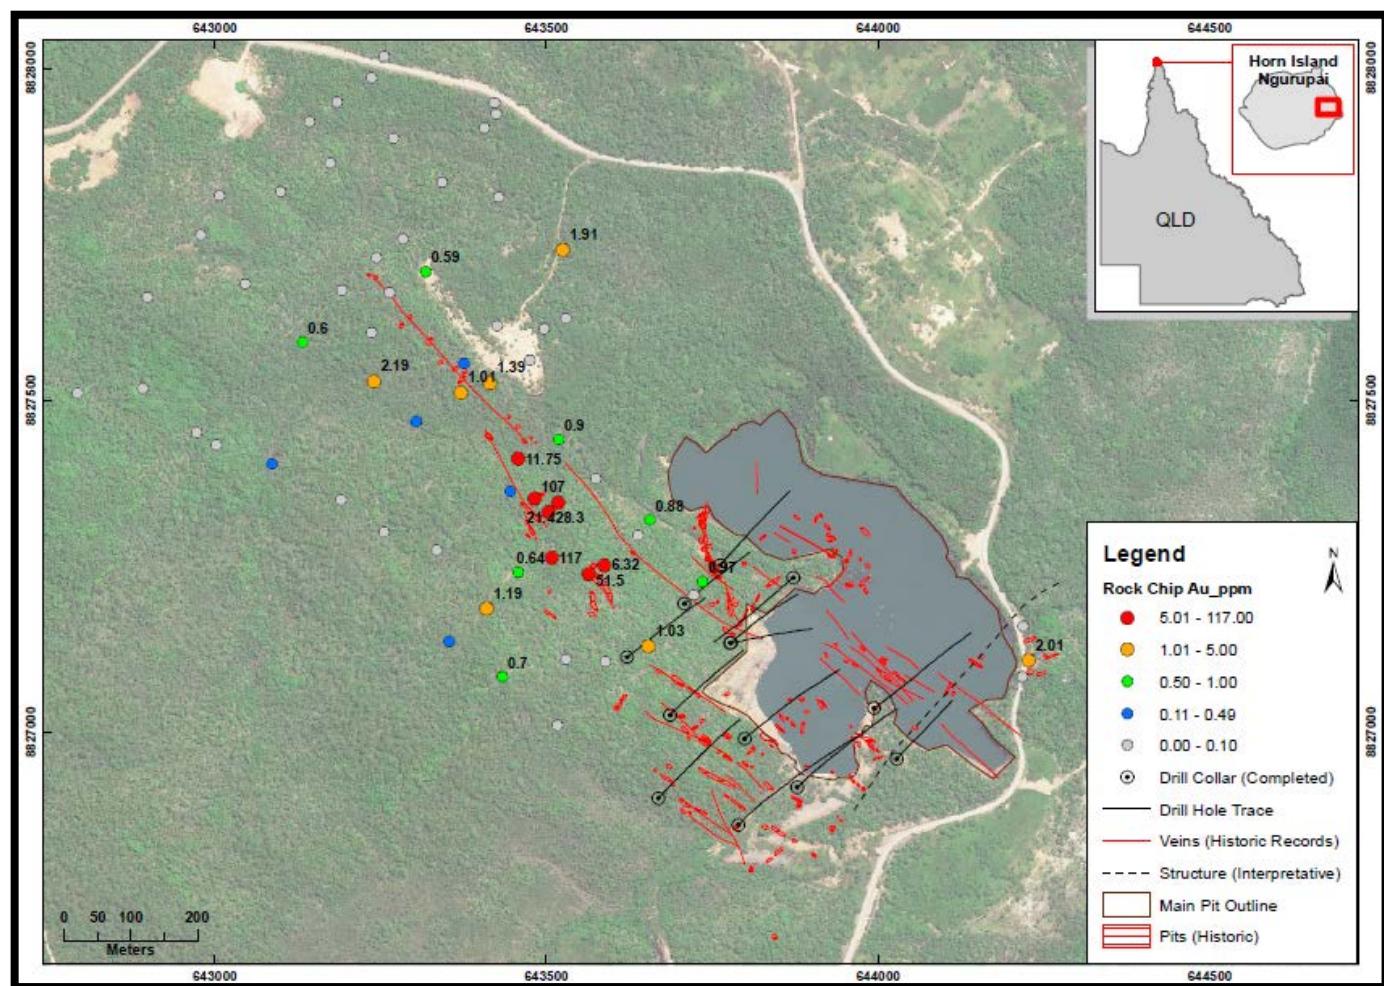

Figure 3. Surface samples (Au g/t = Au ppm)

SUMMARY

Phase one drilling at the former Horn Island Mine site indicates that gold occurs in quartz-sulphide vein zones - nearer surface there is more higher grade gold and arsenopyrite (and sometimes coarse gold) in the vein zones, and deeper there are broader vein zones with lower grade gold and base metal (zinc and lead) sulphides. Overall grade is function of vein density. Prediction of vein density and therefore grade distribution will be a goal of further work at the site.

The old Mine area tested to date measures 600m x 500 x 300m depth, and is just one small part of a large island group which has seen no exploration since 1989. Alice Queen, together with its Kaurareg partners, intends to survey and evaluate its 320 square kilometre exploration permits in the Torres Strait where numerous occurrences are reported in historical literature. Alice Queen believes the permits are prospective for more quartz-sulphide vein deposits like Horn Island, as well as epithermal gold-silver deposits which are a particularly attractive economic target.

FORWARD PLANNING

All data from the phase 1 program is currently being compiled and processed to develop plans for phase 2 exploration. These may include:

- ⌘ Further drilling in the old mined area
- ⌘ Fieldwork to define drill targets on other known gold occurrences on Horn Island
- ⌘ Preliminary Fieldwork on EPM 25418 Kaiwalagal to verify historical reports of gold mineralization

COMPETENT PERSON STATEMENT

The information in this report that relates to Exploration Results is based on information compiled by Mr John Holliday, a Competent Person who is a member of the Australian Institute of Geoscientists. Mr Holliday is a director of Alice Queen Ltd and Kauraru Gold Pty Ltd. Mr Holliday has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Holliday consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

JORC 2012 EDITION, TABLE 1 CHECKLIST

SAMPLING TECHNIQUES AND DATA

Criteria	Explanation
Sampling Techniques Surface Sampling	Selective grabs of visibly mineralised rock were sampled by a geologist during regional mapping traverses. These samples may be expected to be high grade and not necessarily representative of the rock units or veins mapped.
Sampling Techniques Diamond Drilling	<p>Core sample intervals selected by geologist to honour lithology, alteration and mineralisation boundaries</p> <p>Overburden not sampled</p> <p>Sampling intervals are typically >10cm core length and <2.5m</p> <p>Samples are cut by core saw, with half core retained in core tray</p> <p>Cut line is 5mm to the right of the core orient line, bottom of core; with right side being sampled</p> <p>Cut core is sealed in plastic bags with unique id tag</p> <p>Approximately 3.5kg of sample per 1m of core</p>
Drilling Techniques	<p>Wireline diamond core drilling</p> <p>Atlas Copco CS14 track mounted drill rig operated by Eagle Drilling NQ Pty Ltd</p> <p>Oriented core with Reflex ACT instrument</p> <p>Core size HQ3 (Triple tube). Core diameter 61.1mm, hole diameter 95.6mm</p> <p>Steel casing placed and left in all holes, up to 9m</p>

Drill Sample Recovery	Core recovery was measured from drillers run blocks. Poor recovery in overburden and strongly oxidised zones All intervals recovered > 80% discounting overburden All significant intervals grading >1g/t Au recovered >97%
Logging	Core measured for recovery and RQD by drill run, data entered into Access database Intervals of lost core assessed and assigned Intervening meter marks are labelled on core tray Core orient line marked from end of run and assessed against runs above and below Logged for lithology, structure, alteration and mineralisation Sample intervals assigned based on above parameters and given unique sample ids Sample intervals are generally >10cm and less than 2.5m QAQC samples inserted Two-part plastic sample id tag is stapled into core tray, half is removed and placed in sample bag once core is cut Core is photographed, wet, in shade with high megapixel camera
Sub-sampling techniques and Sample Preparation	No sub-sampling or compositing has taken place Samples suspected to be mineralised are crushed to 70% passing 2mm sieve, ALS method CRU-31 Samples suspected to be barren are crushed to 70% passing 6mm sieve, ALS method CRU-21 Crushed samples are split to 1000g using rotary splitter 1000g splits are pulverised to 85% passing 75um, ALS method PUL-32 Pulverised splits are resplit to 50g aliquot for fusion and fire assay 250g pulps are dissolved in Four Acid "near" Total digestion (HF-HNO3-HClO4-HBr) prior to multi-element ICP analysis
	Balance of pulps and coarse reject are retained in storage for further study
Quality of assay data and laboratory tests	Gold assay determined by Fire Assay with Atomic Absorption finish, ALS method AU-AA26 Detection limits 0.01 - 100 g/t Overlimits gold assayed by dilution of aliquot and AU-AA26 Presence of coarse gold is tested by Screen Fire Assay with AA finish (ALS Method SCRAA22) where initial Fire Assay is greater than 5 g/t Au, or visible gold is noted Silver analysis by 4 acid digest and Atomic Absorption (ALS Method Ag-OG62). All silver analyses >50 g/t by AA are repeated with fire assay

	All finalised assay certificates signed off by qualified assayer
	ALS Global Ltd is an ISO certified organisation with industry leading quality protocols
Verification of sampling and assaying	<p>Client supplied Certified Reference Materials including three different gold grade standards and blank material were submitted within the sample stream</p> <p>Field duplicates were selected for second split after crushing stage</p> <p>251 QAQC samples were inserted into 3426 drill core samples for a total of 14 shipments</p> <p>ALS internal CRMs and duplicates were also reported prior to release of finalised certificates</p> <p>No hole twinning has been undertaken</p> <p>No outside audit of results or procedures has been undertaken</p> <p>All logging and sampling undertaken under the supervision of a qualified geologist</p>
Location of data points	<p>Collars X and Y set with handheld GPS (+/-5m) and surveyed post-drilling with differential GPS (+/-2cm) using a base station on survey control points with 1km</p> <p>Z control taken from location on Digital Elevation Model derived from LiDAR data, Queensland State Government 2011 acquisition (+/-1m). Post-drilling with differential GPS (+/-2cm) using a base station on survey control points with 1km</p> <p>All locations using MGA94 UTM Zn 54 coordinates</p> <p>Down hole surveys completed during drilling with Reflex single shot magnetic camera, at 30m intervals</p> <p>Post-drilling holes downhole surveyed with north seeking gyroscopic camera at 10m intervals</p>
	<p>Where post-drilling gyroscopic surveys were incomplete due to hole blockage, relative difference between single shot surveys were used below the blockage, with the last gyroscopic survey considered absolute. These survey points are noted as "Single Shot Factored" in Table 7 and should be considered of lower confidence.</p>
Data spacing and distribution	<p>Drillholes are continuously sampled from base of overburden to end of hole</p> <p>Sections are oriented 045 TN and approximately 100m apart.</p> <p>Collars are 100 - 200m spaced along section</p> <p>Drill holes are inclined -50 to -60° from the horizontal</p> <p>This spacing is not adequate to result in a resource estimate</p>
	Drill azimuth of 045° is orthogonal to mapped strike of historical reefs worked

Orientation of data in relation to geologic structure	Historical reefs dip -75 to 90° to the southwest while drillhole dips are -50 to -60° in the opposite direction (northeast) Hole dip is set for maximum drilling efficiency, depth and lateral reach
Sample Security	All samples selected and supervised by a qualified and experienced geologist All samples are sealed in plastic bags with cable ties immediately after cutting All samples are stored in a secure, permanently staffed facility prior to shipping Sample bags are loaded into polyweave sacks, and each sack is affixed a numbered, tamper-proof id tag which is cross checked upon receipt at destination Sacks are loaded into bulker bags for transport Bulker bags are sealed Shipments travel by ship from Ngurupai (Horn Island) to Cairns, then onshipped to ALS Minerals, Townsville by road Shipping is undertaken by reputable transport logistics specialists with freight security protocols
Audits or Reviews	No external or third party contractor has undertaken any audit or review of these procedures. These audits/reviews will be undertaken in course of future resource estimation

REPORTING OF EXPLORATION RESULTS

Criteria	Explanation
Mineral tenements and land tenure status	Kauraru Gold Ltd is the 100% undivided and unencumbered owner of EPM25520 covering the Nguruapi Project EPM 25520 is in good standing, with an expiry date of 7/10/2019 Kauraru Gold Ltd is a joint venture company between Alice Queen Ltd and the Kaurareg Aboriginal Land Trust Surface title for portions of the historic Horn Island Mine site is held by the Torres Shire Council Other land areas above EPM25520 are held by the Kaurareg Aboriginal Land Trust
Exploration done by other parties	Nil

Geology	<p>Horn Island is located on the partly submerged Badu-Weymouth Belt (formerly Cape York – Oromio Ridge) of the Carboniferous-Permian Kennedy (Igneous) Province. The Badu- Weymouth Belt comprises felsic and intrusive igneous rocks of Upper Carboniferous age exposed on Cape York, the Torres Strait Islands and the southern shore of Papua New Guinea. The oldest Horn Island rocks (figure 2 and 3) are the Carboniferous Torres Strait Volcanics, which comprise welded tuff, ignimbrite and agglomerate, volcanic breccia and minor sediments.</p> <p>The Volcanics are intruded by the Late Carboniferous Badu Suite Granites, which are a series of high-level granites comprising a number of compositional and textural types – leucocratic biotite granite, porphyritic biotite granite and adamellite, and hornblende-biotite adamellite and granodiorite. Alluvial cover and laterite developed from Early Tertiary and Miocene time to the present.</p> <p>The Horn Island gold mineralisation has never been studied in great detail but summary descriptions based on limited information are provided by Levy and Storey, 1990 and von Gnielinski , 1996. The mineralisation occurs in quartz ± sulphide vein arrays/stockworks and breccias that are localised close to the contact of two Badu Suite intrusions (the Badu Granite and the Horn Island Granite) into various felsic welded tuffs (the Endeavour Strait Ignimbrite). The old mined zone is aligned NW to SE with the main historical old workings extending for at least 1500m over an area about 600m wide. Roughly half of this area is now under water in the open pit created in the 1980's. Geochemical information indicates gold is associated with base metal sulphides (galena especially). Alteration is mostly described as sericitic or propyllitic.</p>
Drill hole information	Collar locations and downhole survey information are located in tables appended
Data aggregation methods	<p>No data aggregation or compositing of samples has taken place</p> <p>Subsequent intervals of similar assay grade may be aggregated by length weighting to report a longer composite in text statements, however the individual assays which make up these composites are presented in tables appended</p> <p>No top cutting of assays has been applied</p> <p>Zones of significance are defined as those greater than 1 g/t Au</p> <p>For display and statistical purposes, below detection limit assays are set to 10% of the detection limit, i.e >0.01 g/t is set to 0.001g/t</p> <p>Above detection limit assays, if no follow up method has determined a quantitative value, are reported as the upper detection limit</p>
Relationship between	Historical reefs dip -75 to 90° to the southwest while drillhole dips are -50 to -60° in the opposite direction (northeast)

mineralised widths and intercept lengths	Insufficient structural information exists to calculate true widths of individual veins or mineralised zones. Infill drilling, and intercepts on an alternative drilling orientation will be required to calculate true widths
Diagrams	Figures show plan and section views of drill holes
Balanced reporting	Assays are received for 15NGD001 through 16NGD013
	Reported assays are greater than 1 g/t Au, all other received assays are <1 g/t Au
Other substantive exploration work	No other exploration results which have not previously been reported, are material to this report
Further Work	13 drillholes are completed for a total of 3659.8m. Further drilling will be proposed on completion of data compilation and structure modelling.
