TENNANT CREEK

Ownership: 100%

Location: NT, Australia

Highlights:

- Follow up exploration generates further high grade gold and copper results from the Jelatang Prospect, one of 3 porphyry intrusive centres in the Pinang-Pinang Project within Aceh
- First drilling at Jelatang with 2 diamond core holes intersecting high copper/gold values with best intercepts of:
 - PNGD017: 17 metres @ 1.27g/t gold & 0.7% copper ending in mineralisation.
 - PNGD019: 14 metres @ 0.55g/t gold & 0.5% copper
- More encouraging Jelatang trenching results including:
 - Trench J12: 40 metres at 2.00g/t gold and 0.06% copper
- Mineralisation at Jelatang is open to the northwest and southeast
- Overall Aceh regional package of 410km² has at least 6 porphyry intrusive centres discovered to date all of which are mineralised.

Prosperity Resources Limited (ASX: PSP) is pleased to announce excellent gold and copper results in analyses of soil, rock chip, trench, and drill hole samples from the Jelatang Prospect. The Jelatang Prospect is one of three intrusive centres in the Pinang-Pinang Project area located two kilometres southeast and along strike of the Pala Prospect where copper/gold intersections have been returned from previous drilling (announced to the ASX on 18 February 2010).

Jelatang Prospect Porphyry Discovery Confirmed

Prosperity Resources has recently completed a grid-based, 1.1 kilometre long by 700 metre wide soil sampling program over the Jelatang Prospect, in conjunction with rock-chip, trench and channel sampling and a ground magnetic survey. High grade gold and copper results from this program are shown in figures 5, 6 and 7 below.

Two diamond drill holes, designed as an initial test of the down dip extension of the largest and most coherent domain of surface geochemistry and ground magnetic response have been completed. Both holes intersected long intervals of disseminated and quartz-sulphide stockwork veinlet-hosted anomalous mineralisation, along with shorter intervals of higher grade replacement skarn mineralisation. Hole PNGD017 finished in mineralisation.

Chairman, Mr Mo Munshi said “our licenses in Aceh continue to produce excellent results. The inaugural drilling program at Jelatang produced our best intercept to date in our Aceh tenement package and we are now even more excited about the potential of the area”.

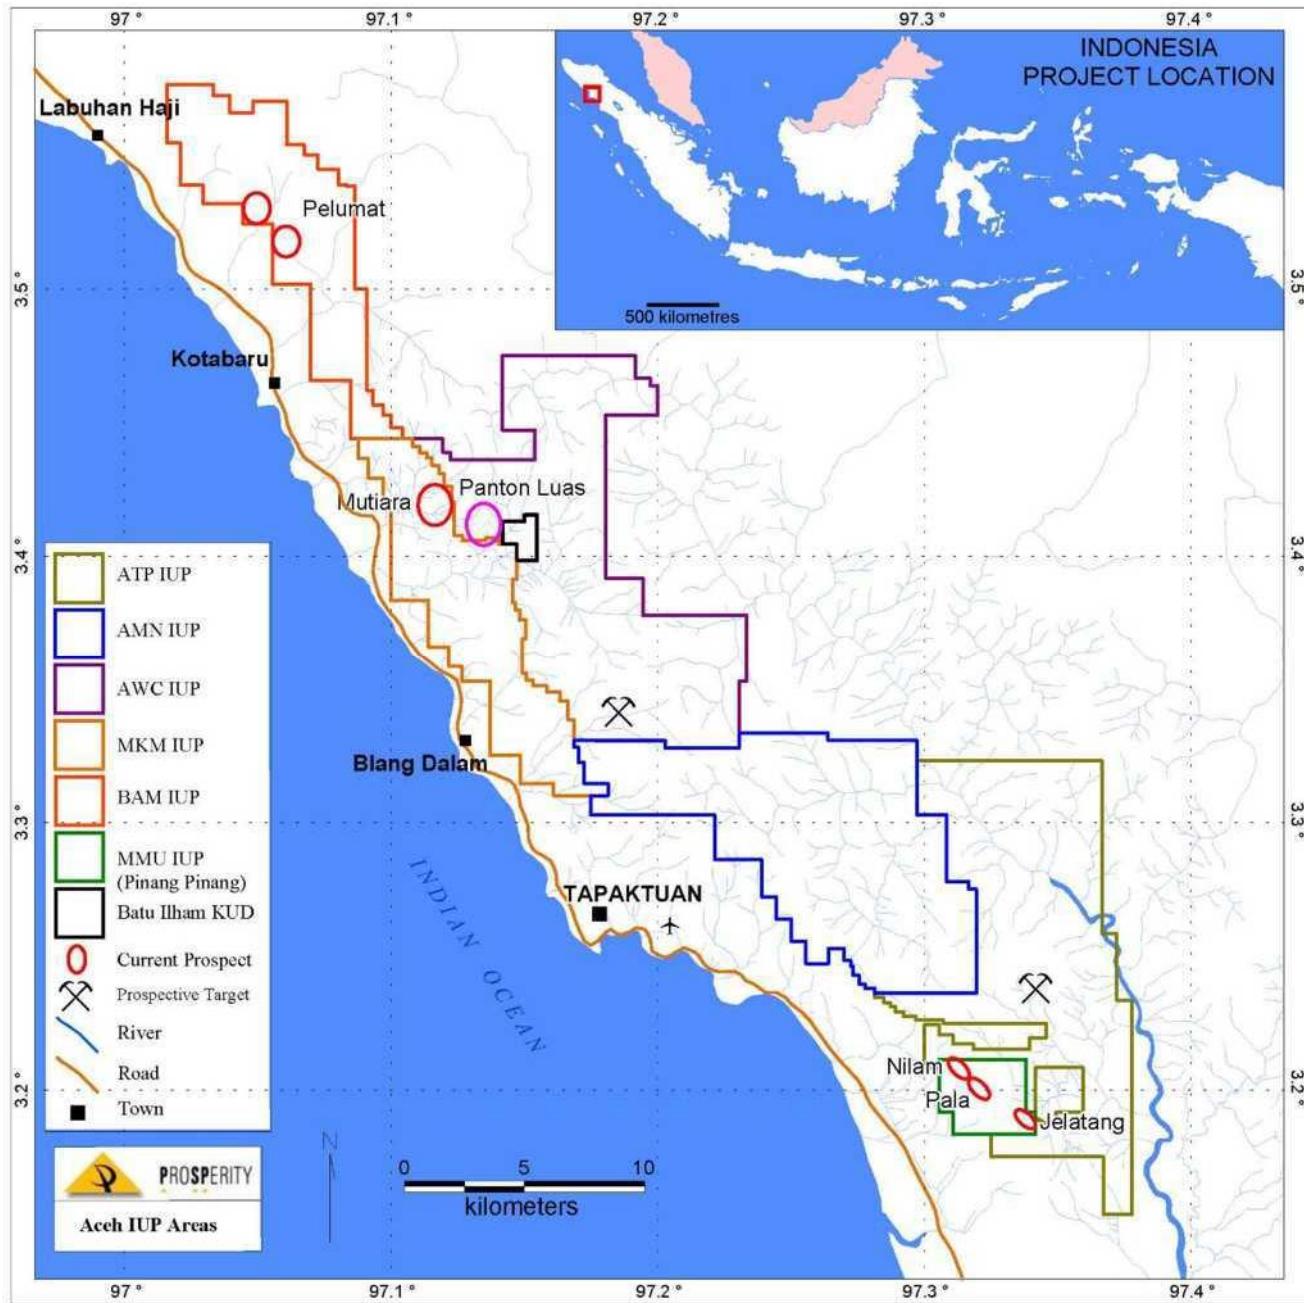

Figure 1: Location Map: Prosperity's Aceh IUPs

Jelatang Prospect Drilling Results

The two diamond drill holes completed intersected long intervals of disseminated and quartz-sulphide ± magnetite stockwork veinlet-hosted mineralisation, along with shorter intervals of higher grade replacement skarn mineralisation. Hole PNGD017 finished in mineralisation with the last **17 metres** returning an intercept of **1.27g/t gold and 0.7% copper** (figure 2).

PROSPERITY

Drill holes PNGD017 and PNGD019 confirm surface domains of disseminated and stockwork-controlled pyrite-chalcopyrite mineralisation and genetically-related replacement endoskarn within a vertically extensive microdiorite intrusive complex. Widespread, pervasive porphyry-style alteration, including hydrothermal magnetite, along with the disseminated-style of gold and copper mineralisation spatially associated with more restricted zones of higher grade, proximal replacement endoskarn suggest mineralisation intersected to date may be associated with a large porphyry system at depth.

Results from the two scout diamond core holes are as follows:

JELATANG PROSPECT					
Drill hole	From (m)	Interval (m)	Au g/t	Cu %	
PNGD017	179	50	0.57	0.30	
Including	212	17	1.27	0.70	
PNGD019	113	56	0.18	0.16	
Including	155	14	0.55	0.46	

The mineralisation is open to the northwest and southeast and extends outside the MMU license and into the newly granted Arus Tirta Power (ATP) IUP. The new IUP includes an old, shallow iron ore open-pit mine which may be a significant extension to the zone drilled. Further exploration is proposed on the newly acquired ATP IUP and if successful has the potential to extend the size of the mineralised zone considerably.

Geology / Jelatang Sampling Results

The Jelatang Prospect is one of the three mineralised porphyry intrusives along six kilometres of strike in the Pinang-Pinang Project (MMU IUP) and extending to the southeast in to the ATP IUP.

Prosperity Resources has recently completed a hand auger soil sampling program over the Jelatang Prospect, in conjunction with rock-chip, trench and channel sampling, and a ground magnetic survey.

Anomalous gold and copper in soil, rock (grab) and trench sampling define a broad, northwest-orientated mineralised corridor at least 2 kilometres long. (Figures 5 & 6).

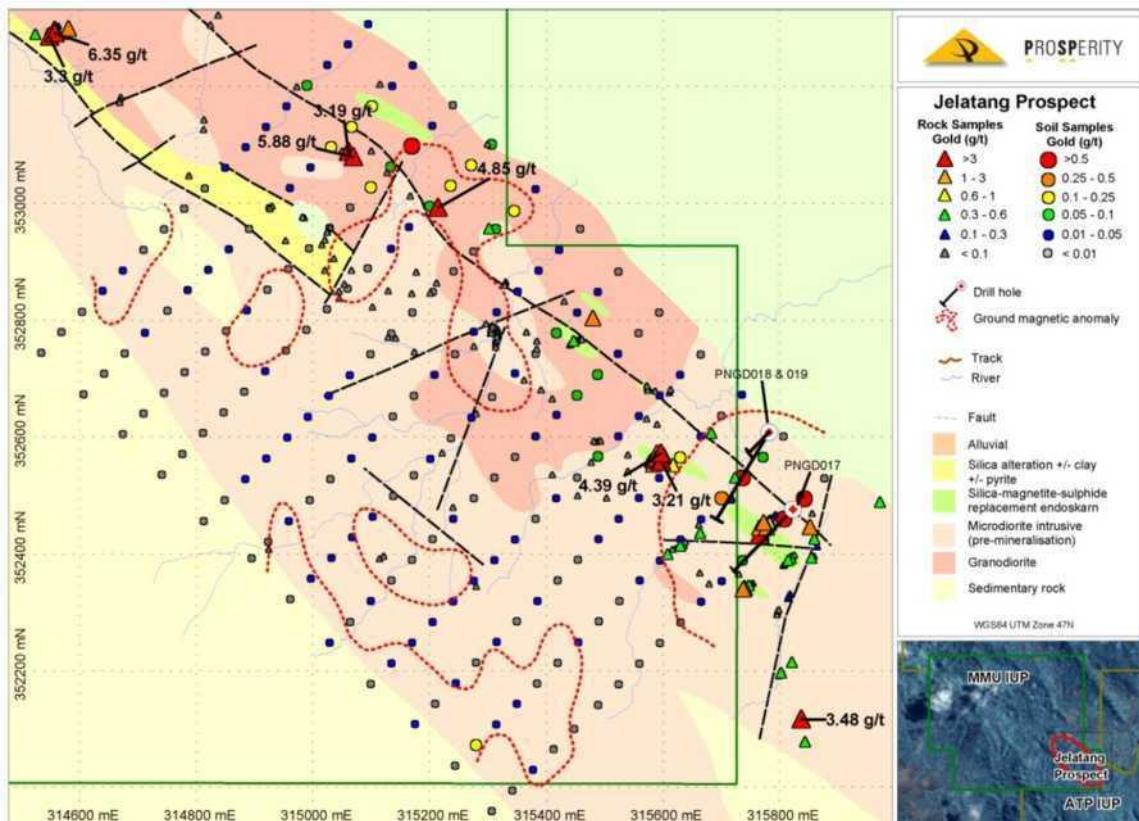

Figure 5: Jelatang rock chip and soil gold sample results

Multiple soil geochemical anomalies, individually up to 300 metres long and 250 metres wide, coinciding with domains of elevated ground magnetic response are confirmed by mapping to be spatially related to:

- broad domains of porphyry-related disseminated and stockwork-hosted pyrite-chalcopyrite mineralisation
- breccia-hosted replacement endoskarn (silica-magnetite-sulphide)
- pervasive, porphyry style silica-hydrothermal magnetite (and chlorite-sericite) alteration.

Anomalous soil geochemistry mimic the trend of mapped rock units, structures, and domains of lithologically- and breccia-controlled endoskarn, zones of disseminated sulphide and locally (leached) silica alteration. The microdiorite-hosted replacement endoskarn mineralisation, exposed by trenching largely along ridge tops, is genetically related to a more subtle style of disseminated and stockwork veinlet-controlled mineralisation identified in outcrops within adjacent creeks

Assays from rock chip samples at **Jelatang** produced excellent gold grades including **6.35 g/t**, **5.88 g/t** and **4.85 g/t** gold and **1.36% copper**.

PROSPERITY

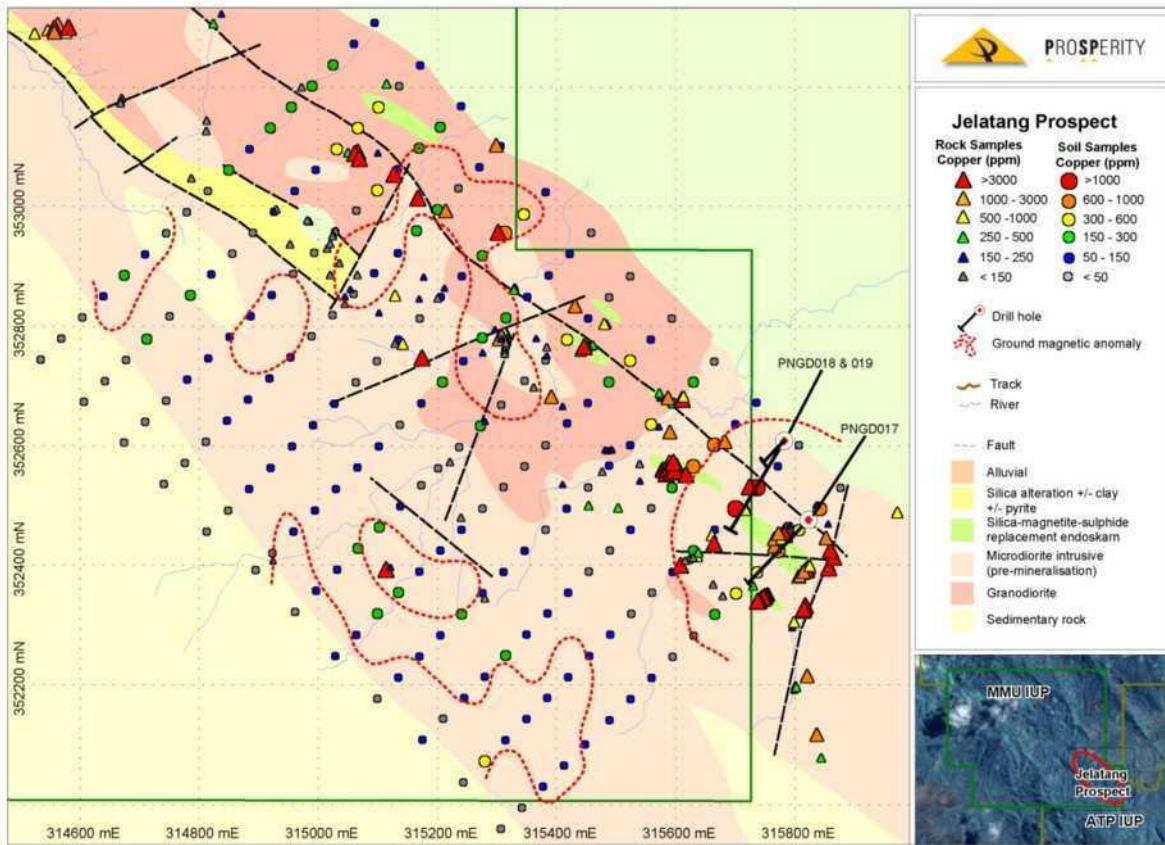

Figure 6: Jelatang rock chip and soil copper sample results

Prosperity continued the program of trenching at Jelatang which commenced in 2009 (Figure 7). The highlights from the **Jelatang** trenching results are:

- Trench J12; **40 metres @ 2.00g/t gold and 0.06% copper**,
- Trench J10; **9 metres @ 3.08g/t gold and 0.32% copper**,
- Trench J11; **27 metres @ 0.26g/t gold and 0.08% copper**

Previously reported trench results from Jelatang (PSP ASX release 12/10/09) included:

Trench J1 which returned: **24 metres @ 2.32g/t gold and 0.27% copper**.

PROSPERITY

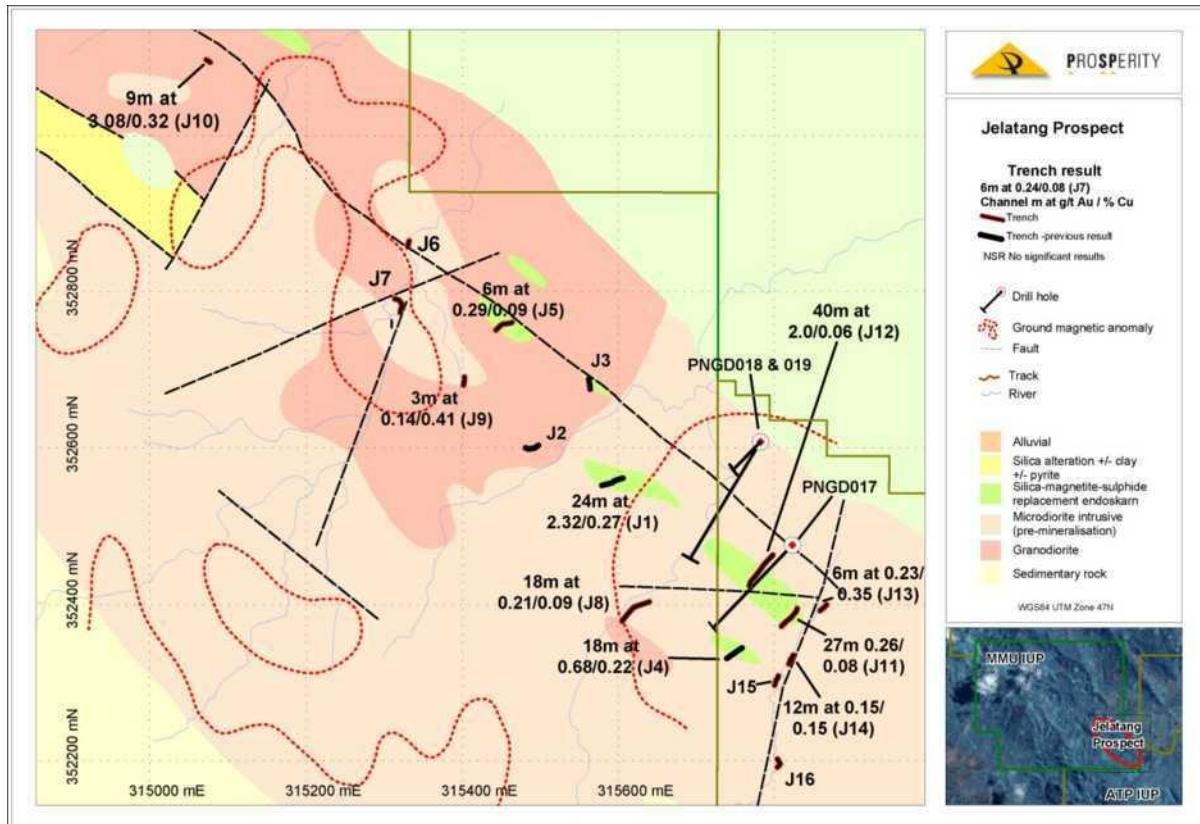

Figure 7: Jelatang trench results. (Note Hole 18 was terminated and recommenced as Hole 19)

Competent Person Statement

Information in this announcement that relates to Exploration Results is based on information compiled by Michael Ivey, Principal of M Ivey Pty Ltd trading as MetalsEx Capital, who is a Member of The Australasian Institute of Mining and Metallurgy. Michael Ivey is a permanent employee of MetalsEx Capital and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 JORC Code. Michael Ivey consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

Grid Coordinates WGS84 Zone 47 North.

Lower cut of 0.05g/t Au or 0.05% Cu used for drilling intercepts.

All drill intervals are reported as down hole lengths.

A maximum of 5 consecutive metres dilution per reported intersection.

Trench samples taken at 3 metre intervals.

Gold analysis was undertaken by Intertek Jakarta by fire assay analysis. Copper was analysed by ICP following acid digest.
