

ASX RELEASE | 26 September 2012 | ASX:PIR

DRILLING CONTINUES TO DELIVER THICK, HIGH GRADE INTERSECTIONS AT FEKOLA

- ▶ Results from drilling at the Fekola Project continue to confirm continuity of gold mineralisation, both in terms of thickness and grade;
- ▶ Thick zones of high grade mineralisation intersected from near surface to maximum vertical depth of 260 metres, including intersections of 38 metres @ 11.61 g/t, 53 metres @ 8.06 g/t and 52 metres @ 7.90 g/t gold;
- ▶ Steady flow of assay results from recently completed drilling campaign expected over coming months; and
- ▶ Future extension and exploration drilling, aimed at aggressively growing the Fekola resource base and testing priority targets along the Fekola Corridor, is scheduled to commence in late October.

Papillon Resources Limited ('Papillon' or 'the Company') is pleased to announce further assay results from the recently completed 2011/2012 drilling program at the Company's flagship Fekola Project ('Fekola' or 'the Project'), located in south western Mali.

The Project currently hosts a Mineral Resource Estimate ('MRE') which comprises 40.1 million tonnes averaging 2.4 g/t gold for a contained 3.14 million ounces of gold at a lower cut-off grade of 1.0 g/t gold.

The results of an additional 90 reverse circulation ('RC') and diamond drill holes (reported herein) have further demonstrated continuity of the gold mineralisation, in terms of thickness and grade, between previous broader spaced holes within the resource area. Thick zones of high grade mineralisation have been recorded from near surface to a maximum vertical depth of 260 metres, with better intercepts including:

<i>Hole No.</i>	<i>Down Hole Intercept</i>	<i>From Depth (Down Hole)</i>
<i>FKD 014</i>	<i>38m @ 11.61 g/t</i>	<i>171m</i>
<i>FKCR 211</i>	<i>53m @ 8.06 g/t</i>	<i>13m</i>
<i>FKRD 011</i>	<i>52m @ 7.90 g/t</i>	<i>182m</i>
<i>FKCR 214</i>	<i>29m @ 12.22 g/t</i>	<i>4m</i>
<i>FKCR 205</i>	<i>51m @ 6.91 g/t</i>	<i>74m</i>
<i>FKRD 003</i>	<i>66m @ 5.15 g/t</i>	<i>234m</i>
<i>FKCR 213</i>	<i>62m @ 3.35 g/t</i>	<i>12m</i>
<i>FKD 031</i>	<i>36m @ 5.44 g/t</i>	<i>21m</i>
<i>FKD 023</i>	<i>29m @ 6.05 g/t</i>	<i>79m</i>
<i>FKCR 185</i>	<i>35m @ 4.69 g/t</i>	<i>27m</i>

The 2011/2012 drilling program comprised a total of approximately 52,000 metres of drilling. Diamond drilling accounted for approximately 60% of the drill metres, with the balance being RC. The majority of this drilling was focused on the Fekola MRE area, infilling between the previous broader spaced holes. Due to slow turnaround times experienced at the in-country laboratory, assay results for a significant portion of the holes drilled during the campaign (~30,000 metres) are still pending and the Company anticipates a steady flow of results over the coming months.

The drilling completed at Fekola to-date extends over a strike length of approximately 2km, which represents a small portion of the strike extent of the highly prospective Fekola Corridor, and extends to a maximum vertical depth of 260m. Mineralisation remains open at depth and along strike to both the north and south.

The next drilling campaign, scheduled to commence in late October 2012, will be predominantly focussed on aggressively expanding the MRE (extending the mineralisation along strike and at depth) and testing priority targets along the Fekola Corridor.

With the current Scoping Study ongoing and a further extensive drilling campaign planned, the Company continues to focus on rapidly advancing the exploration, appraisal and potential development of this outstanding project.

Introduction

Papillon is pleased to report additional assay results from the 2011/2012 drilling program at the Company's flagship Fekola Project, located in south western Mali (Figures 1 and 2).

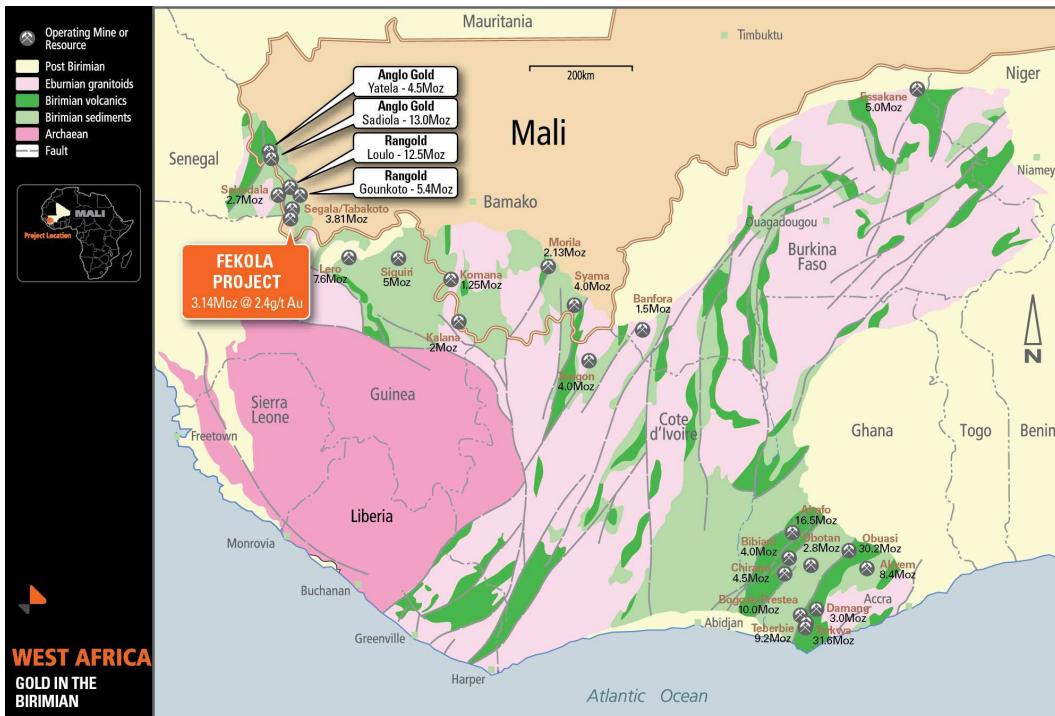

Figure 1: Fekola Project – Location Map

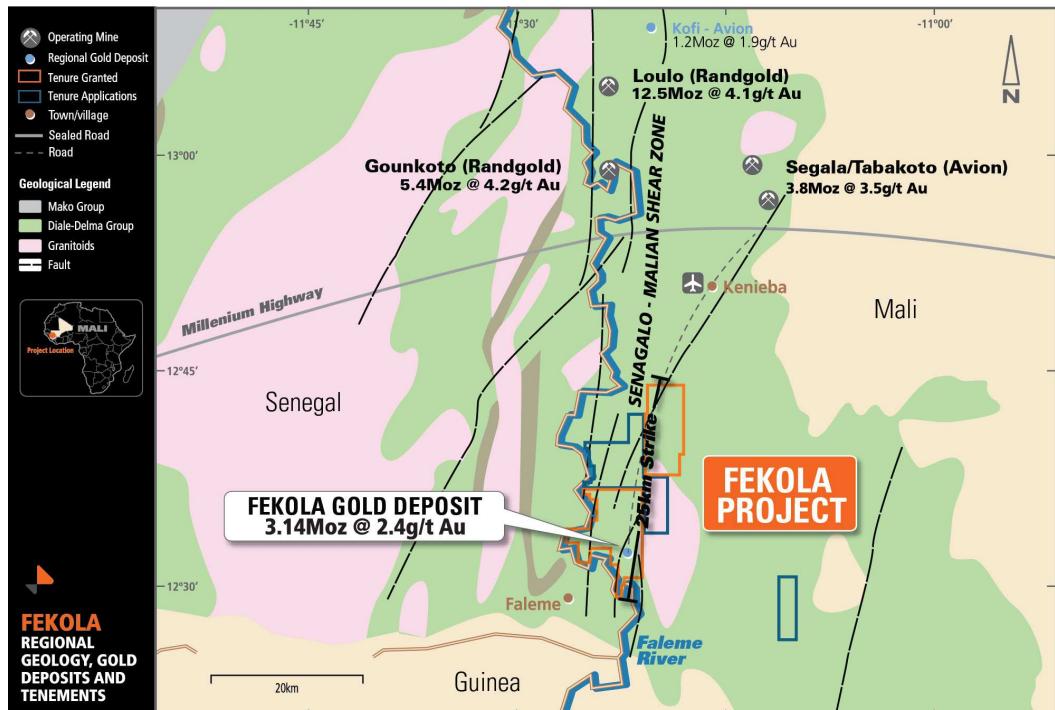

Figure 2: Mali West – Regional Geology, Gold Deposits and Papillon Tenements

The Project currently hosts a Mineral Resource Estimate ('MRE') of 40.1 Mt averaging 2.4 g/t gold for a contained 3.14 Mozs of gold at a lower cut-off grade of 1.0 g/t gold (refer ASX Announcement dated 4 July 2012).

Fekola Project Mineral Resource Estimate - July 2012			
	Tonnage (million tonnes)	Grade (g/t gold)	Contained Gold (million ounces)
Indicated Resource	10.5	2.75	0.93
Inferred Resource	30	2.3	2.21
Total Resource	40.1	2.4	3.14

Notes: The resource is reported at a lower cut-off grade of 1.0 g/t gold

The resource is estimated on a 100% basis of which 90% is attributable to Papillon

All figures are rounded to reflect appropriate levels of confidence. Apparent differences occur due to rounding

A Scoping Study on the Project is in progress and scheduled to be completed during the December quarter of 2012. A metallurgical testwork program, undertaken as part of the Scoping Study, has recently been completed and produced very encouraging results including leach recoveries in excess of 93%. The testwork results indicate that Gravity Recoverable Gold by gravity concentration and a conventional Carbon in Leach ('CIL') process are best suited to the Project (refer ASX Announcement dated 3 September 2012).

Drilling Programs

The 2011/2012 drilling program, which concluded in late July with the onset of the wet season in Mali, comprised a total of approximately 52,000m of drilling. Diamond drilling ('DD') accounted for approximately 60% of the drill metres, with the balance being reverse circulation ('RC'). The majority of this drilling was focused on the Fekola MRE area, infilling between the previous broader spaced holes.

Due to slow turnaround times experienced at the in-country laboratory, assay results for a significant portion of the holes drilled during the 2011/2012 campaign (~30,000m) are still pending and the Company anticipates a steady flow of results over the coming months. Given these delays, the Company has commenced a detailed review of sampling and assay workflows with a view to identifying opportunities to debottleneck the process and reduce the time lag between a hole being drilled and the assay results being available.

The drilling completed at Fekola to-date extends over a strike length of approximately 2km, which represents a small portion of the strike extent of the highly prospective Fekola Corridor, and extends to a maximum vertical depth of 260m. Mineralisation remains open at depth and along strike to both the north and south.

The next drilling campaign, scheduled to commence in late October 2012, will be predominantly focussed on aggressively expanding the MRE (extending the mineralisation along strike and at depth) and testing priority targets along the Fekola Corridor.

Drilling Results

The results of an additional 90 RC and DD drill holes, representing approximately 15,000m of infill drilling are reported herein.

The gold mineralisation intersected in the new infill holes has shown that good continuity, of both thickness and grade, exists between the previous broader spaced holes within the resource area (Figure 3). Within the clearly defined, shallow northerly plunging, high grade shoot, thick zones of mineralisation have been recorded from near surface to a maximum vertical depth of 260 metres. These results provide further support to the MRE announced in July 2012.

Select intercepts (quoted as down-hole intercepts) include:

Hole No.	Down Hole Intercept	From Depth (Down Hole)
FKD 014	38m @ 11.61 g/t	171m
FKCR 211	53m @ 8.06 g/t	13m
FKRD 011	52m @ 7.90 g/t	182m
FKCR 214	29m @ 12.22 g/t	4m
FKCR 205	51m @ 6.91 g/t	74m
FKRD 003*	66m @ 5.15 g/t	234m
FKCR 213	62m @ 3.35 g/t	12m
FKD 031	36m @ 5.44 g/t	21m
FKD 023	29m @ 6.05 g/t	79m
FKCR 185	35m @ 4.69 g/t	27m

* hole ended in mineralisation

Gold mineralisation at Fekola is hosted within a sequence of finely laminated quartzite, fine grained sedimentary rocks and mafic intrusive rocks. The mineralised zone is characterised by the strong association between gold and widespread silicification and pyrite alteration. The alteration consists primarily of hematite, carbonate, albite, pyrite and a strong pervasive silicification producing a very typical jasperoid rock that is usually the host of the gold mineralisation. Mineralisation trends in a north-north-west orientation with the broad mineralised package dipping steeply to the west at approximately 80 degrees. A high grade shoot is observed to be shallowly plunging at approximately 20 degrees in the north-north-west trend.

All significant intersections returned from the new drill holes, along with the details of the collar positions, dips, azimuths and depths, are summarised in Tables 1 and 2.

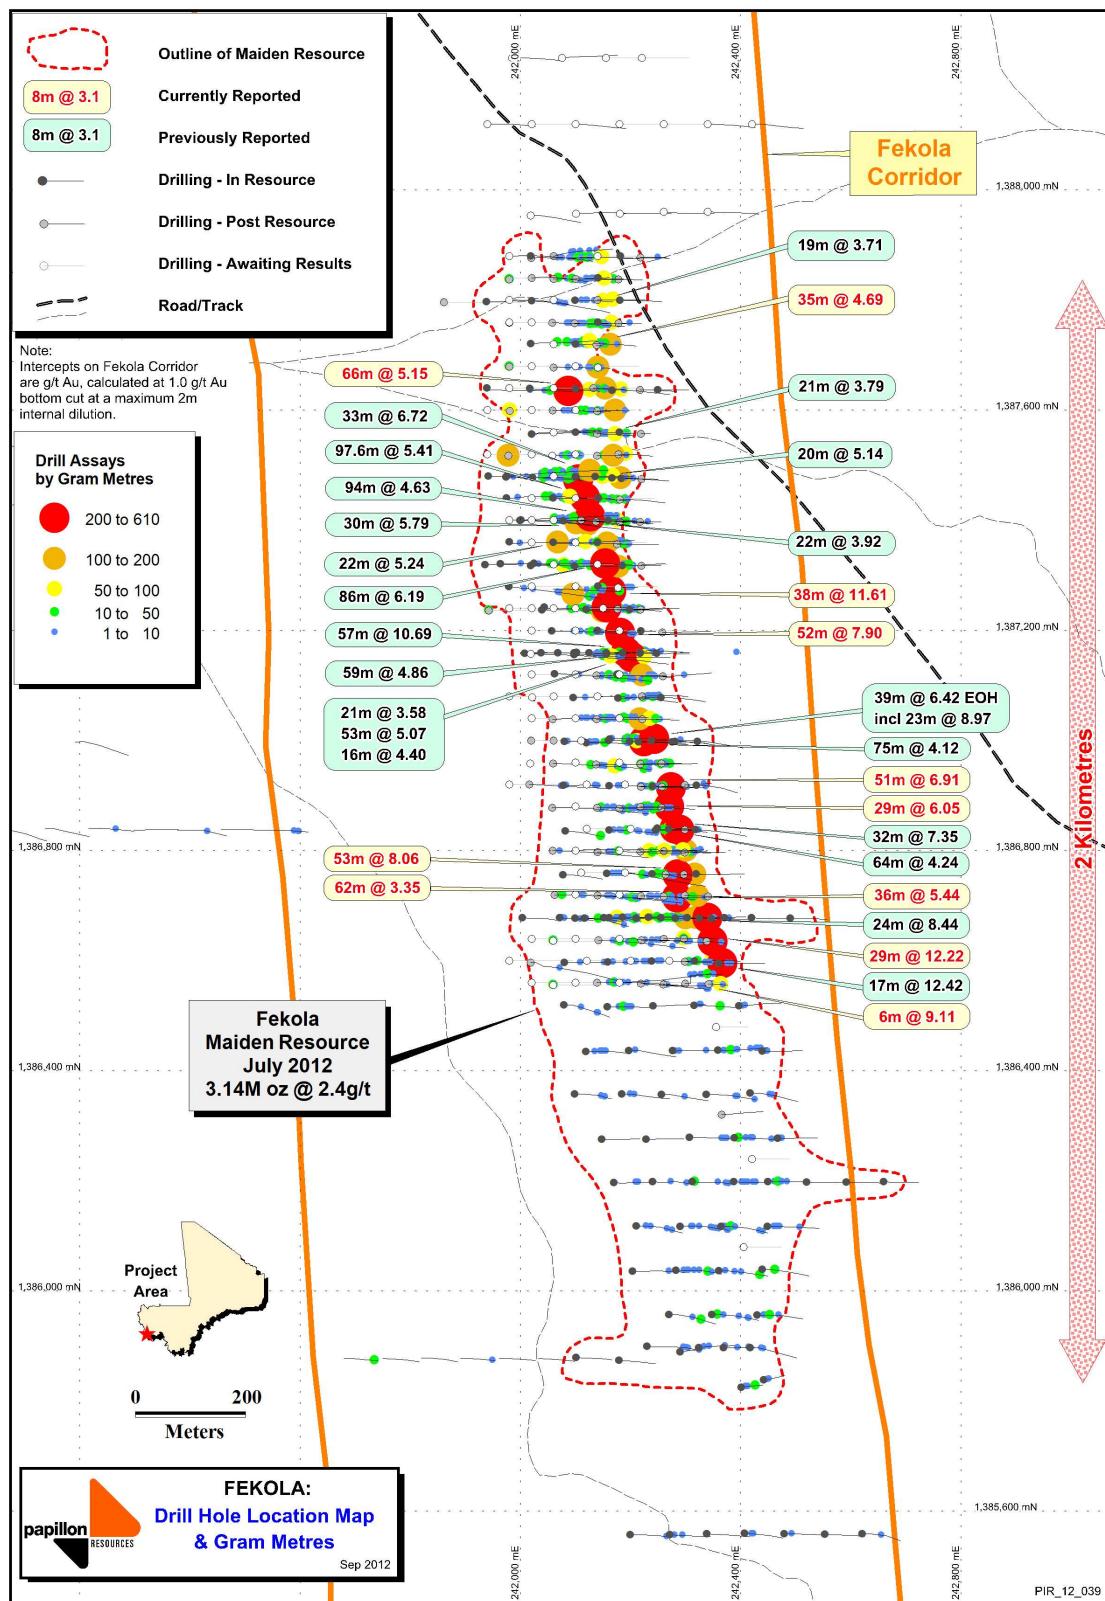

Figure 3: Fekola Drill Hole Location Map and Significant Intercepts

Competent Persons Statement

The information in this Report that relates to Exploration Results is based on information compiled by Mr. Robert Behets, who is a Fellow of The Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists. Mr. Behets has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves ('The JORC Code'). Mr Behets consents to the inclusion in this Report of the statements based on his information in the form and context in which it appears.

The information in this Report that relates to Mineral Resources is based on information compiled by Mr Nic Johnson of MPR Geological Consultants. Mr Johnson is a Member of the Australian Institute of Geoscientists and has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves ('The JORC Code'). Mr Johnson consents to the inclusion in this Report of the statements based on his information in the form and context in which it appears.

The information in this Report that relates to Metallurgical Test Work Results is based on information compiled by Mr Glenn Bezuidenhout of DRA Mineral Projects. Mr Bezuidenhout is a Fellow of The South African Institute of Mining and Metallurgy, and has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves ('The JORC Code'). Mr Bezuidenhout consents to the inclusion in this Report of the statements based on his information in the form and context in which it appears.

Forward Looking Statement

Statements regarding plans with respect to the Company's mineral properties are forward-looking statements. There can be no assurance that the Company's plans for development of its mineral properties will proceed as currently expected. There can also be no assurance that the Company will be able to confirm the presence of additional mineral deposits, that any mineralisation will prove to be economic or that a mine will successfully be developed on any of the Company's mineral properties.

Notes to all Tables:

1. Co-ordinates are in UTM grid (WGS 84 Zone 29P) and have been measured by GPS (+/- 5m accuracy).
2. * indicates hole ended in mineralisation.
3. Samples at 1m intervals.
4. All Intercepts calculated using a 1.0 g/t lower cut, no upper cut, maximum 2m internal dilution.
5. Intervals are all down-hole length.
6. Assaying conducted by SGS Analabs, Mali using industry standard 50g lead collection fire assay with AAS finish.
7. Reference standards, field duplicates and blank samples are routinely inserted; quality control samples are routinely monitored.
8. The broad mineralised zone dips to the west at approximately 80°. Local variations in mineralisation dip occur within the broad mineralised zone.
