DRILLING RECOMMENCES AT KHUL MORIT PROJECT

Voyager Resources Limited (the Company), is pleased to announce that drilling has recommenced at the Company's flagship Khul Morit Project in Mongolia.

Recent assay results, supported by compelling alteration signatures, provides the strongest indication to date that the Khul Morit Project has the potential to host a **significant copper porphyry system**, and the initial targets identified within this drill programme will target this system. These targets are the result of the extensive audit the Company completed on the Project in recent months.

Voyager Resources is fully funded to undertake and complete this drill programme and is equipped to continue drilling throughout the winter season.

Results from this drill programme will be announced on an ongoing basis.

About the Khul Morit Project

The Khul Morit Project (Figure 1) is located in the Erdene Island Arc Terrain, which is one of a number of tectonic terrains that extend across the Gobi and southern regions of Mongolia that have been proven to host a number of mineralised copper porphyry systems, including the giant Oyu Tolgoi deposit.
