

ASX ANNOUNCEMENT/MEDIA RELEASE

2 November 2023

Ground EM Highlights Potential 700m Strike Extent of Nickel Bearing Massive Sulphide Mineralisation at Luhuma

- Completed ground EM confirms highly conductive modelled plate in the SW of Luhuma Central
- Total potential massive sulphide strike extent of 700m
- Ground EM plate previously been drill tested correlates with massive and semi-massive nickel sulphide intersections
- Recently completed RC hole at Luhuma Central confirmed the continuation of more primitive and nickel sulphide prospective high MgO lithologies in this SW direction
- Diamond drilling to test the SW extension of the highly conductive EM plate hosted in the more primitive lithologies scheduled to commence this week
- RC drilling in progress at HEM 4 confirms coincident gravity, geochemical and EM anomalies are associated with prospective mafic lithologies

Adavale Resources Limited (ASX: ADD) (“or the Company”) is pleased to advise that follow-up ground Electromagnetic (EM) surveys north and south of the previously conducted orientation survey at Luhuma Central have identified a south westerly continuation of the high-quality EM anomaly associated with the Luhuma Central massive sulphide mineralisation. This south westerly portion of the Luhuma mafic-ultramafic intrusion is the same area Adavale recently recognised as having potential to host more primitive and therefore prospective ultramafic lithologies (*refer to Company ASX announcement dated 12 October 2023*).

Adavale’s Executive Director, David Riekie commented:

“Our recent drilling at Luhuma Central has shown that the area to the SW is where the more primitive portion of the Luhuma intrusion is likely to be located. It is also very pleasing to see that our ground EM has demonstrated continuity into this area of the highly conductive EM plate associated with the massive and semi-massive sulphide intercepts at Luhuma Central. The SW modelled strike extent of the EM anomaly has been extended to a total of 700 metres. Preparations are now being made to diamond drill test this SW extension of the EM plate.

In addition, the initial RC drill test of the coincident gravity, geochemical and EM targets identified at HEM 4 have shown these targets coincide with prospective mafic lithologies at depth. This is a positive outcome and justifies ongoing RC testing of this area.”

ABOUT ADAVALE

Adavale Resources is an ASX-listed exploration company targeting projects in the 'battery materials' space. The company is currently focused on both its 100% owned Kabanga Jirani Nickel Project and 2 Farm-in 'Luhuma' licences adjacent and along strike from the world's largest undeveloped high grade NiS resource of 58Mt @ 2.62% Ni. Adavale is also progressing exploration on its 100% owned uranium tenements in South Australia

Outcome of Luhuma Central Ground EM

Following on from the recently completed orientation EM survey at Luhuma Central, Adavale has now completed the detailed ground EM surveys across the entire previously identified airborne EM anomaly at Luhuma. The survey lines and modelled plates generated by the surveys are shown in Figure 1. The central plate is the initial orientation survey area that was conducted over the previously reported drillholes DDLUHC 001 to DDLUHC005 to verify that ground EM could correctly identify the massive sulphide mineralisation intersected at depth.

Based on the successful correlation confirmed through this orientation survey, additional surveys were conducted to the north and south of the orientation survey. These extended surveys have now enabled anomalies to be identified and modelled over the full strike length of the Luhuma airborne EM anomaly. It should be noted that the northernmost plate has a lower modelled conductance than the central plate, thereby implying that the sulphide mineralisation may not be as well developed in this area. The modelled plates extending across the central survey area and further to the south do however show an equally strong measure of conductance to the central plate, implying that the massive sulphide mineralisation intersected in the central area extends to the south. These high conductance plates cover a strike extent of about 700m. The southern extent of the southern plate will be drill tested with a diamond drill hole planned to start shortly (see Figure 1).

Figure 1: Locality of plates modelled from ground EM including collar positions of historically drilled holes as well as locations of planned RC holes and diamond hole overlying historic airborne EM

The continuation of the higher conductance zone towards the south-west coincides with an area of the Luhuma intrusion that was recently identified as significantly more primitive (more MgO rich) as shown in Figure 2 below and elaborated on in Company ASX announcement 12 October 2023. To support the distribution and classification of rock types shown in Figure 2, a total of 15 samples from within the three recognised units have been sent to the University of Dar es Salaam in Tanzania for detailed petrological descriptions.

In light of the ground EM results reported in this document, Adavale may alter the RC programme outlined in the 11 October 2023 announcement, possibly in line with the RC holes shown in Figure 1. The first of these two holes has been completed and confirmed the primitive nature of the lithologies at this location returning 18% MgO.

Figure 2: The increasing MgO content towards the SW is illustrated above with the red colour depicting the most primitive rock (Gabbronorite).

HEM 4 RC Drilling

At HEM 4, RC drilling is continuing to determine if a series of coincident EM, geochemical and gravity anomalies identified there are associated with favourable host rocks at depth below the cover sequence.

The locality of the first two completed RC drillholes (RCKE016 and RCKE017) are shown in Figure 3. The holes were completed to their planned depths of 146m and 150m respectively. Both RC holes intercepted mafic lithologies (gabbro). Initial results of this program are expected in early November.

Figure 3: Location of planned and completed RC Drillholes relative to Geochemical and Geophysical Anomalies.

Next Steps

Included in the upcoming news flow will be the following:

- Results from RC drilling at Luhuma Central
- Diamond Drillhole result from Luhuma Central
- Results from RC drilling at HEM 4

This announcement is authorised for release by the Board of Adavale Resources Limited.

Competent Persons Statement

The information in this release that relates to "exploration results" for the Project is based on information compiled or reviewed by Mr David Dodd of MSA, South Africa. Mr Dodd is a consultant for Adavale Resources Limited and is a member of the SACNASP. Mr Dodd has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration as well as to the activity that is being undertaken to qualify as a Competent Person under the ASX Listing Rules. Mr Dodd consents to this release in the form and context in which it appears.

Cautionary Statements

Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.

The Company regularly uses a portable hand-held XRF analyser to screen drill core for mineralisation before cutting and sampling. This allows for some understanding of the distribution of mineralisation prior to sampling to better ensure that the sampled core is representative of the type and style of mineralisation. Numerous readings are obtained and recorded for future reference. The hand-held XRF provides confirmation that mineralisation is present however it is not an accurate determination of the elemental concentration within the sample analysed. Limitations include very small analysis window, possible inhomogeneous distribution of mineralisation, analytical penetration depth and possible effects from irregular rock surface. The pXRF readings are subject to confirmation by chemical analysis from an independent laboratory.

Forward looking statements

This document contains forward-looking statements concerning Adavale. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory restrictions, including environmental regulation and liability and potential title disputes. Forward looking statements in this document are based on Adavale's beliefs, opinions and estimates of Adavale as of the dates the forward-looking statements are made, and no obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments. Although management believes that the assumptions made by the Company and the expectations represented by such information are reasonable, there can be no assurance that the forward-looking information will prove to be accurate. Forward-looking information involves known and unknown risks, uncertainties, and other factors which may cause the actual results, performance or achievements of the Company to be materially different from any anticipated future results, performance or achievements expressed or implied by such forward-looking information. Such factors include, among others, the actual market price of nickel, the actual results of future exploration, changes in project parameters as plans continue to be evaluated, as well as those factors disclosed in the Company's publicly filed documents. Readers should not place undue reliance on forward-looking information. The Company does not undertake to update any forward-looking information, except in accordance with applicable securities laws. No representation, warranty or undertaking, express or implied, is given or made by the Company that the occurrence of the events expressed or implied in any forward- looking statements in this document will actually occur.

ABOUT ADAVALE

Adavale Resources Limited (ASX:ADD) is a nickel sulphide exploration company that holds 100% of the Kabanga Jirani Nickel Project, a portfolio of 12 highly prospective granted licences covering ~1,216km² along the Karagwe-Ankolean belt in Tanzania. The six southernmost licences are proximal to the world-class Kabanga Nickel Deposit (58Mt @ 2.62% Ni). Adavale has farmed-in to two more highly prospective licences contiguous to our seven southernmost licences, adding a further 99km² to the portfolio (1,315sq km). Adavale's licences were selected based on their strong geochemical and geophysical signatures from the previous exploration undertaken by BHP.

Adavale also holds exploration licences for their sedimentary uranium potential within the northern part of the highly prospective Lake Frome Embayment in South Australia.

Appendix 1

Adavale Resources Limited – Reverse Circulation and Diamond Drilling Program - Kabanga Jirani Nickel Project JORC Code Edition 2012: Table 1

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>RC drilling is conducted primarily to identify the presence of mafic/ultramafic intrusions or to pre-collar ahead of converting to diamond drilling. RC chips that are identified as mafic or ultramafic are initially analysed with a pXRF, but representative samples are also submitted to ALS (South Africa) for analyses by ICP MS.</p> <p>For RC analyses sampling is not representative of the broader geological horizons and simply represents values derived from select points. The pXRF has been calibrated using the AMIS standards AMIS0315, AMIS0317, AMIS0319, AMIS0329, AMIS384 and AMIS0367. Standards used to verify quality of results measured include AMIS0317 and AMIS0315.</p> <p>If mineralisation is intercepted with RC drilling than RC material will be captured for every metre drilled. The material is put through a riffler and one third is taken for further analyses where it is sieved to remove the chips which are stored in a chip tray. Both the fines and the chips are logged and analysed using the pXRF to record Ni values. MgO values are also noted for each lithological interval. Any mineralised fines will be submitted for analyses using aqua regia digest.</p> <p>All sampling equipment must be cleaned between samples to prevent contamination.</p> <p>SG is calculated at site using a pycnometer and measurements are taken systematically down the drillhole. This is used to reconcile intercepted lithologies against the modelled gravity anomalies to verify that the causative source has been intercepted.</p> <p>For diamond drilling sampling takes place as follows:</p> <p>Core is aligned and a cutting line is drawn to prevent sampling bias.</p> <p>Samples are marked off in pre-defined intervals of 1 m or smaller if required to honour lithological contacts.</p> <p>The core is split along the china marker reference line. The sampling depth and sample ID are then transferred onto the half core remaining so that the core can be revisited and act as a reference.</p> <p>The remaining sampled half of the core is then submitted to an accredited laboratory (ALS South Africa) along with QAQC samples which will form 15% of all samples submitted and will include certified blanks and Ni standards.</p>

Criteria	JORC Code Explanation	Commentary
<i>Drilling techniques</i>	<ul style="list-style-type: none"> • <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	Combination of RC and diamond drilling using NQ sized core. Current depth limit of RC drilling is 150m and for diamond drilling is 600m.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> • <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> • <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> • <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<p>For RC Drilling</p> <p>Bulk sample retrieved from the cyclone, sample is put through the riffler and 2 to 3 kg sample retrieved for analyses (if required). Chips from this sample are extracted by washing some of the sample material – these chips are placed in a chip tray in order to keep a record of lithologies for each metre drilled. The riffler is cleaned with compressed air between sample collection to prevent contamination.</p> <p>For Diamond Drilling</p> <p>RQD measurements are taken of core to record recovery. Nature of mineralisation is not nuggety and prone to strong variations in grade that correlate to core loss or loss of fines. Sample length may be compromised when drilling through massive sulphides where core loss is often prevalent.</p>
<i>Logging</i>	<ul style="list-style-type: none"> • <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<p>The following is recorded for each interval in the lithology log: Borehole ID, From and to depths, lithology code, weathering, colour, grain size, rock texture and contact type and angle.</p> <p>The following is recorded for each mineralized interval in the mineralisation log: borehole ID, from and to depths, mineralisation type, mineralisation style and mineralisation abundance (usually as a sulphide percentage)</p> <p>Chips from RC drilling are stored in a chip tray with a representative sample captured for every metre.</p>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> 	<p>Drill core has been cut in half with half core remaining in the core tray and the other half submitted to the laboratory. Where the lithology is uniform samples are taken at 1 m intervals otherwise sample lengths are dictated by geological contacts.</p> <p>RC material has been captured for every metre drilled. For details of sampling technique see “Sampling techniques” section.</p>

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	Core samples will be analysed by SGS Tanzania and/or ALS laboratory in South Africa. An aqua regia digest will be used to avoid the inclusion of silicate Ni. CRM's, blanks and standards have been inserted to verify laboratory accuracy, precision or bias. QAQC samples will form 15% of all samples submitted. In some instances a four-acid digest will also be used and some samples may be analysed by SGS in Tanzania.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<p>Chips from RC drilling are stored in a chip tray with a representative sample captured for every metre to enable check sampling to be undertaken.</p> <p>All logging and pXRF readings have been undertaken by a senior exploration personnel. Primary data was collected in the core shed using a set of standard logging templates and entered into a tablet with tailor made dropdown menus. The data is forwarded to their independent data management consultant (MSA) for validation and loading into the company's drilling database.</p>
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	The drillhole collars were surveyed with a handheld GPS unit with an accuracy of 5m which is considered sufficiently accurate for the purpose of the drillhole. All co- ordinates are expressed in Arc1960.

Criteria	JORC Code Explanation	Commentary
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> • <i>Data spacing for reporting of Exploration Results.</i> • <i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> • <i>Whether sample compositing has been applied.</i> 	No regular drill hole spacing has been set with individual holes design to intersect specific targets. Diamond drillholes were designed to test coincident gravity, Geochemical and HEM/DHEM and AMT anomalies.
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> • <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> • <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	Drillholes are designed to intercept conductors orthogonally if possible or alternatively to drill through the EM anomalies.
<i>Sample security</i>	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	Samples are kept in the core shed and then delivered in person by the geologist to the courier company from where they are dispatched to the laboratory.
<i>Audits or reviews</i>	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	Internal audits/reviews of procedures are ongoing, however no external reviews have been undertaken.

Section 2: Reporting of Exploration Results

Criteria	JORC Code Explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<p>The Kabanga Jirani Nickel Project located in Tanzania covering 1,215.97km² comprises of ten granted licences, all are 100% owned by Adavale Resources as follows:</p> <p>PL 11406 298 km² Kabanga Northeast</p> <p>PL 11886 23 km² Kabanga Southeast</p> <p>PL 11405 114 km² Kabanga North</p> <p>PL 11538 64 km² Burigi</p> <p>PL 11537 194 km² Burigi North</p> <p>PL 11591 182 km² Kabanga East</p> <p>PL11590 273 km² Kabanga West</p> <p>PL11592 19.4 km² Ruiza Northeast</p> <p>PL 12175 44.83 km² Southeast Wedge</p> <p>PL 23980/2023 3.74 km² Luhuma Central</p> <p>In addition, there are two licences with farm-in agreements (65% ownership interest)</p> <p>PL11692 26 km², Luhuma North</p> <p>PL11693 73 km², Luhuma South</p>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	Not applicable, not referred to.
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	The exploration target is a magmatic Ni-Cu-PGE sulphide with the same genesis to the Kabanga N-Cu-PGE sulphide deposit that the licences are adjacent to.
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> 	<p>DDLUHC 001</p> <p>Easting 261206</p> <p>Northing 9711222</p> <p>Elevation 1508</p> <p>Azimuth: 120</p>

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> • <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> • <i>dip and azimuth of the hole</i> • <i>down hole length and interception depth</i> • <i>hole length.</i> • <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	<p>Dip: 60° EOH: 300.9m DDLUHC 002 Easting 261267 Northing 9711177 Elevation 1513 Azimuth: 120 Dip: 60° EOH: 451.3m DDLUHC 003 Easting 261182 Northing 9711297 Elevation 1515 Azimuth: 115 Dip: 60° Planned EOH: 361.3m DDLUHC 004 Easting 261149 Northing 9711143 Elevation 1512 Azimuth: 120 Dip: 65° EOH: 386m DDLUHC 005 Easting 261084.4 Northing 9711109.9 Elevation 1512 Azimuth: 130 Dip: 60° EOH: 501.1m</p>
<p><i>Data aggregation methods</i></p>	<ul style="list-style-type: none"> • <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i> • <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical</i> 	<p>Assay results from drilling are weighted according to sample length.</p>

Criteria	JORC Code Explanation	Commentary
	<p><i>examples of such aggregations should be shown in detail.</i></p> <ul style="list-style-type: none"> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i> 	Not applicable – insufficient data available at this point to describe relationship between mineralisation widths and intercept length.
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	Plan views and cross-sections have been provided
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	Once laboratory results are received more comprehensive reporting will be submitted.
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	No other material information that hasn't been reported.
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	Diamond and RC drilling is continuing, and new drill hole collars will be finalised based on drill results and as new geophysical data is modelled.
