

3 APRIL 2025  
ASX RELEASE

# COSMO PROGRESSING BINGARA & NUNDLE GOLD, ANTIMONY & COPPER PROJECTS IN NSW

## HIGHLIGHTS

- Acquisition of the highly prospective Bingara and Nundle gold – antimony and copper projects in the New England Orogen of northern NSW has received overwhelming support from Shareholders at the General Meeting held on 28 March 2025
- Exploration activities underway with contract awarded to complete high-resolution LiDAR and imagery capture across the full extent of both Bingara and Nundle
  - New high quality data set will support surface mapping / sampling and drill hole targeting
- Planning well advanced for drill program to follow up shallow high grade gold mineralisation identified<sup>1</sup> in previous drilling such as:
  - 6.0m at 6.43 g/t Au from 8.0 m incl. 2.0m at 17.59 g/t Au from 12.0m (SC17 – Spring Creek)
- Positioned to progress boots on ground exploration activities and well-funded following closure of the \$1.6 million fully underwritten entitlements issue

Cosmo Metals Ltd (“Cosmo” or the “Company”) (ASX: CMO) is pleased to have received overwhelming Shareholder support for the acquisition of the highly prospective Bingara and Nundle gold - antimony and copper exploration projects (the **Projects**), totalling an area of ~743km<sup>2</sup>, in the New England Orogen of northern New South Wales (**NSW**), Australia. This marks the satisfaction of a further key condition precedent of the Binding Heads of Agreement (**HoA**) as announced on 12 February 2025.

Exploration is underway across the Projects with the award of a contract to complete full coverage of the Bingara and Nundle tenements with high-density light detection and ranging (**LiDAR**) and high-resolution imagery capture. LiDAR provides a highly detailed land surface digital terrain model (**DTM**) mapping historical workings and revealing underlying geological trends and structures. This data set will enhance the efficiency of the mapping, surface sampling and drill hole positioning phase of exploration.

### Cosmo’s Managing Director, Ian Prentice commented:

*“We are incredibly pleased with the resounding support shown from our shareholders to pursue the acquisition of the Bingara and Nundle projects and excited to be starting out on the execution of our high-impact exploration strategy of these underexplored, high potential assets.*

*The current activity represents the first dedicated modern exploration conducted across the projects since the 1990’s and we’re confident that historical mining and exploration data alongside the LiDAR data will further define the some highly prospective targets for Cosmo to pursue in our upcoming campaigns”.*

## NSW PROJECT PORTFOLIO

Cosmo is acquiring the highly prospective Bingara and Nundle projects totalling an area of ~743km<sup>2</sup>, in the New England Orogen of northern NSW. The New England Orogen, which extends from northern NSW along the eastern coast of Australia up to Townsville in northern Queensland, hosts globally significant orebodies such as the nearby Hillgrove gold-antimony deposit<sup>1</sup> (1.7Moz AuEq) (refer Figure 1) and the Mt Morgan gold-copper deposit in Queensland<sup>2</sup> (historic production of 7.7Moz Au and 361 Kt Cu).

The Bingara and Nundle Projects represent large, camp scale exploration opportunities with evidence of high grade multi commodity mineralisation and contain an extensive pipeline of highly prospective targets that are either under explored or completely untested with modern, systematic exploration.

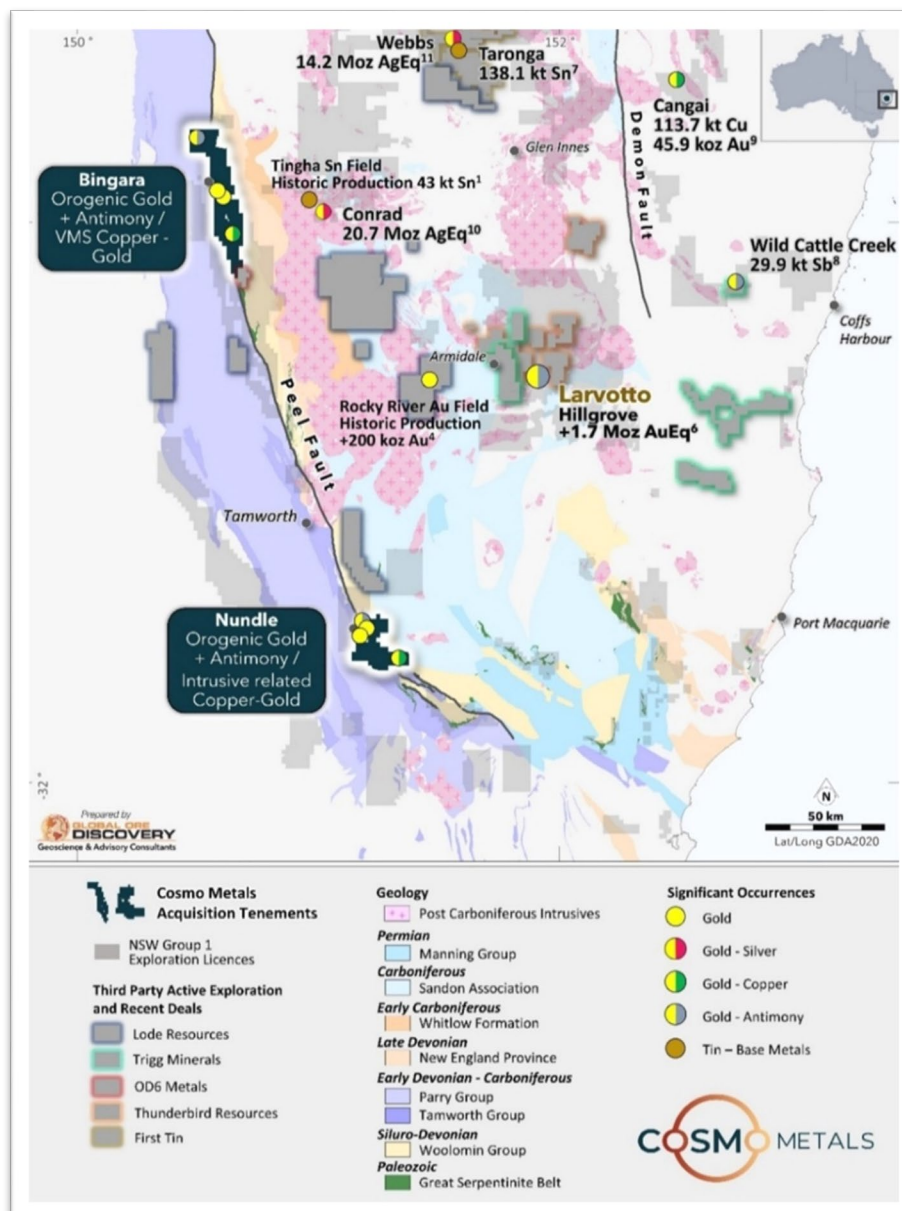

Figure 1. Project location in New England Orogen. See references at the end of the news release for the source of 3<sup>rd</sup> party resource information displayed on the figure.

## EXPLORATION UNDERWAY

Having received overwhelming Shareholder support for the acquisition of the highly prospective Bingara and Nundle gold - antimony and copper exploration projects at the General Meeting of Shareholders held on 28 March 2025, Cosmo is now progressing towards Completion of the acquisition, with the imminent completion of remaining conditions precedent as per the HoA.

This marks the start of exploration activities as part of a high-impact exploration strategy of these underexplored, high-potential assets, with the Company having awarded the contract to complete new high-resolution LiDAR and high-resolution imagery capture across the full extent of both Bingara and Nundle.

LiDAR uses data from aircraft based laser scanners, sending laser pulses at a rate of up to 1 million per second along its flightpath, generating multiple target reflections of the underlying land surface per pulse. The resultant point cloud of target reflections is subsequently processed to define an interpolated model of the ground surface, from which a highly accurate DTM is generated showing very detailed topographic contours and an accurate 3D land form model mapping features like historical workings that may have been obscured by tree cover / foliage and clearly revealing underlying geological trends and structures.

The LiDAR and high-resolution imagery will be used as a high-quality base layer to enhance the efficiency, and fast track, geological mapping, surface geochemical sampling and design of follow-up drilling to test historic gold exploration results at Bingara and Nundle. The LiDAR visible band imagery will be particularly valuable for the Folly Line where recent logging of the plantation pine forest has exposed new outcrop over the area of the historic workings.

The Cosmo technical team site visit completed during the option period confirmed the surface expression of largely untested mineralised systems at both Bingara and Nundle as well as ground truthing the historic exploration completed by previous explorers at a number of highly prospective target areas. The LiDAR data will assist in identifying potential extensions and/or duplications of these mineralised systems.

The LiDAR and high-resolution imagery will support the proposed drilling at the Hidden Treasure – Spring Creek gold trend at Bingara, by both assisting in mapping potential strike extensions of known historic workings as well as allowing better definition of optimal drilling locations to confirm and potentially extend the known gold zone. This area is an early focus of Cosmo's exploration strategy at Bingara initially targeting extensions of the flat lying Spring Creek gold zone outlined by historic drilling, where it is open to the east, and potential for steeper dipping feeder zones targets in the Hidden Treasure area.

At the 2.5km long Mt Everest – Mona VMS copper-gold-zinc trend at Bingara, the LiDAR and high-resolution imagery will combine with the recently collected SAM survey data, to improve the efficiency of the proposed follow up geological mapping and surface sampling. This work is designed to generate anomalies that may represent drill targets for concealed massive sulphide and sulphide-magnetite lenses underlying and along strike from the historic workings.

The **Bingara Project**, covering a contiguous area of 484.1km<sup>2</sup>, contains two sub parallel broadly north south trending mineralised trends that follow the regional scale Peel Fault system (Figure 2).

The Bingara goldfield, defined by a plus 30 km long belt of hard rock gold (antimony) lodes and alluvial workings, were first exploited between 1850 and the 1860's. Antimony production is also reported from the Evans and Corrigan mines in the northwest of the project and mines in the Hidden Treasure – Spring Creek area. Portions of the Bingara goldfield have had limited sporadic historic exploration by numerous companies since the late 1970's. There has been no drilling of the Bingara goldfield since 1996 and areas like the Whitlow Group and Specimen Gully – Lone Hand Trend have never been drill tested.

The Bingara VMS copper-zinc-gold trend extends over a 20 km north-south strike to the east of the Peel Fault and contains six historical Cyprus style VMS Cu-Zn±Au-Ag deposits. At Bingara this belt has seen limited to no systematic surface exploration, modern geophysics or drill testing. Elsewhere in the world, Cyprus style VMS deposits form modest tonnage, high-grade copper-zinc deposits, that can cluster in deposit “camps” and may contain significant gold, as is the case at Bingara

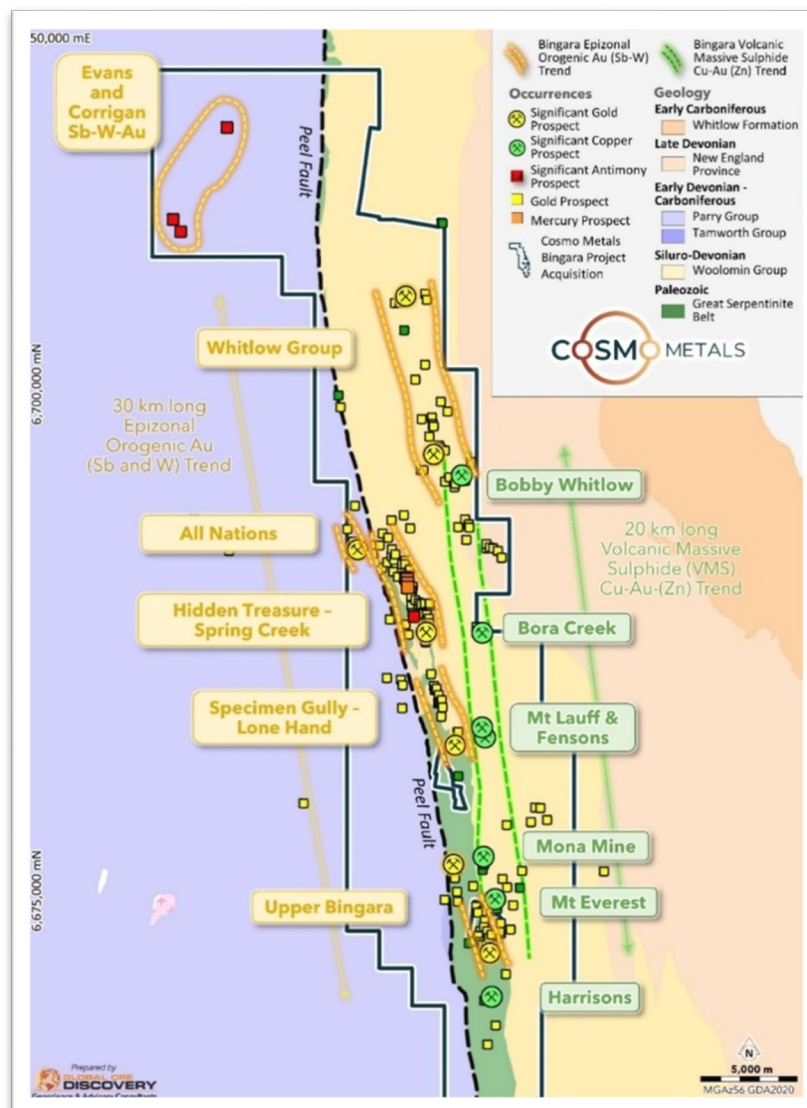

Figure 2. Bingara Project Orogenic Gold (Antimony) Gold Field and VMS Copper-Zinc-Gold Belt.

The **Nundle Project**, covering an area of 259.1km<sup>2</sup> straddling the regional scale Peel Fault contains two key prospective target areas (Figure 3).

A +7.5km long section of the historic Nundle Epizonal Orogenic gold (antimony) field, characterised by steep dipping lodes and stockwork zones with geochemical signatures similar to the Hillgrove gold-antimony (tungsten) mine. The Nundle goldfield was exploited between the 1850's and 1940's, and although total production from Nundle was not well documented, with over 80 individual lodes recorded in the field, production has been estimated to be in excess of 150,000oz of gold<sup>4</sup>.

There are two prospective areas defined within the goldfield within the Nundle Project, the 1.7km long Folly Line parallel to and within the Peel Fault and the Hanging Rock and Tamworth Reefs trend hosted by the Tamworth group sediments and diorite bodies. There is evidence of antimony mineralisation associated with these gold prospects and there is recorded production from the Zwer's Scheelite Mine located 1.7km north of the Folly Line of >4.30 t of Sb<sup>4</sup>.

The Barnard Hut – Back Barb Cu-Au cluster - Intrusion Related copper target area, located in the south east of the Nundle Project, has indications of copper mineralisation based on limited surface exploration completed between 1970 and 1972. The initial phase of trenching work in 1971 included 376 channel samples from trenches that targeted exposed zones of copper mineralisation in the Barnard Hut area, returning strong traces of copper mineralisation over a strike length of approximately 3.2kms. The Barnard Hut prospect is within a regional scale magnetic high anomaly with a north-west trending strike of 4.2km and up to 1.6km wide. Initial work indicates potential for a Mt Morgan style deposit at Barnard Hut.

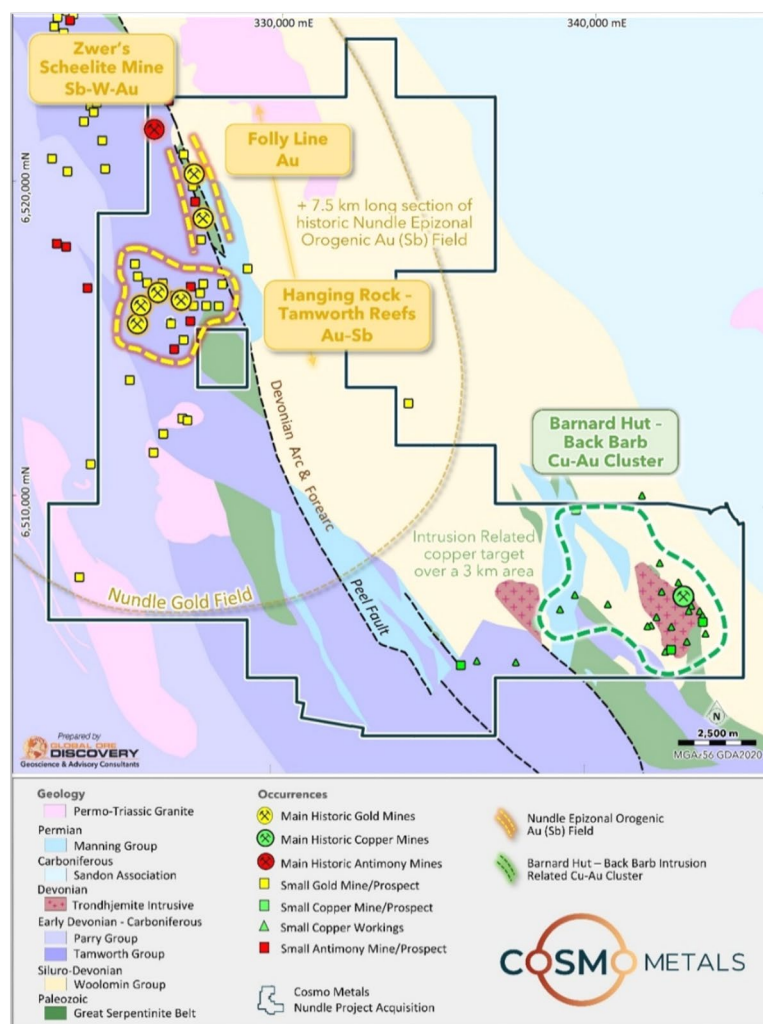

Figure 3. Nundle Project with prospect areas on regional geology

This announcement is authorised for release to the ASX by the Board of Cosmo Metals Ltd.

### **CAUTIONARY STATEMENT**

According to Listing Rule 3.1, the Company informs investors that visual estimates of mineral abundance included in this release should never be considered a proxy or substitute for laboratory analysis where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.

## COMPETENT PERSON'S STATEMENT

The information in this announcement that relates to historical results in respect of the Bingara and Nundle projects is based on information compiled by Mr Ian Prentice, who is a Member of the Australasian Institute of Mining and Metallurgy (AusIMM). Mr Prentice is a director of Cosmo Metals. Mr Prentice has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Prentice consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

## COMPLIANCE STATEMENT

This announcement contains information on the Bingara and Nundle Projects extracted from the ASX market announcement dated 12 February 2025 and reported by the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (2012 JORC Code) and available for viewing at [www.cosmometals.com.au](http://www.cosmometals.com.au). This news release contains references to historic exploration results on the Bingara and Nundle projects that was not performed by the company. CMO is in the process of validating this exploration in the context of reporting standards for the 2012 JORC code but has included reference to these results in this news release to inform shareholders as an indication of potential grade and widths of mineralisation at the project.

CMO confirms that it is not aware of any new information or data that materially affects the information included in any original ASX market announcement

## FORWARD LOOKING STATEMENT

This announcement contains 'forward-looking information' that is based on the Company's expectations, estimates and projections as of the date on which the statements were made. This forward-looking information includes, among other things, statements with respect to the Company's business strategy, plans, development, objectives, performance, outlook, growth, cash flow, projections, targets and expectations, mineral reserves and resources, results of exploration and related expenses. Generally, this forward-looking information can be identified by the use of forward-looking terminology such as 'outlook', 'anticipate', 'project', 'target', 'potential', 'likely', 'believe', 'estimate', 'expect', 'intend', 'may', 'would', 'could', 'should', 'scheduled', 'will', 'plan', 'forecast', 'evolve' and similar expressions. Persons reading this announcement are cautioned that such statements are only predictions, and that the Company's actual future results or performance may be materially different. Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the Company's actual results, level of activity, performance or achievements to be materially different from those expressed or implied by such forward-looking information.

### About Cosmo Metals Ltd

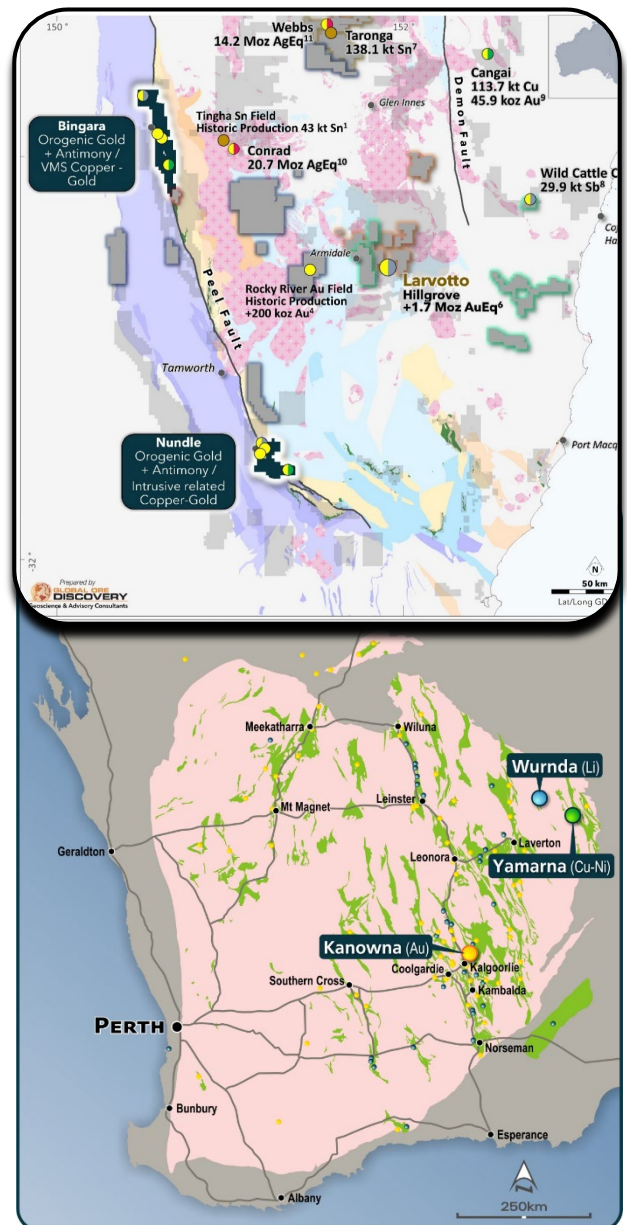

Cosmo Metals Ltd (Cosmo; ASX: CMO) is an ASX-listed gold and base metals exploration company with key projects located in WA and NSW.

Cosmo is acquiring the underexplored and highly prospective Bingara and Nundle gold-antimony and copper projects which cover an area of ~743km<sup>2</sup> in the New England Orogen of northern NSW.

While several high-grade gold, antimony, copper and gold deposits have historically been discovered and mined across the Bingara and Nundle Projects, there has been only sporadic exploration since the 1970's with no drilling in ~30 years.

Cosmo is also advancing work on the Kanowna Gold Project (KGP) located about 13 km north of Kalgoorlie and adjacent to the 7moz Au Kanowna Belle gold mine. Cosmo also owns the advanced Yamarna Project in the Eastern Goldfields region which contains significant intrusive-hosted base metal mineralisation, including the Mt Venn Cu-Ni-Co deposit.

Cosmo is supported by a strong technical team who are advancing exploration on multiple fronts.

## – JORC Code, 2012 Edition – Table 1

This Table 1 refers to historic exploration including drilling, rock chip sampling and costean sampling on EL8574 (Bingara), EL8800(All Nations) and EL8692 (Nundle).

### – Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria                   | JORC Code explanation   | Commentary   |
|----------------------------|---|--|
| <b>Sampling techniques</b> | <ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul> | <p><b>EL 8574 and EL 8800 Bingara &amp; All Nations</b><br/> <u>Spring Creek Drilling</u></p> <p>45 drill holes for 17,37.25 m have been completed across the Spring Creek Prospect by three companies between 1983 and 1996.</p> <p><i>Freeport Australia Pty Ltd 1984</i></p> <ul style="list-style-type: none"> <li>Drilling comprised of 7 drill holes for 346.75 m including 2 percussion pre-collars with diamond tails (SCDH1 &amp; 7) and 5 percussion holes (SCDH2-6).</li> <li>Holes range in length from 14 - 137.25m.</li> <li>Diamond core was NQ size, and the percussion holes were 5.5" drilled with a 4.5" bit. Percussions to NQ change over depths are recorded on logging sheets.</li> <li>Drilling completed by Overland Drilling using a Warman Scout 250.</li> <li>Sample methodology and measures taken to ensure sample representivity are unknown.</li> <li>Samples were analysed at ALS Brisbane.</li> <li>Sample preparation techniques are unknown.</li> <li>Samples were analysed for Au, Cu, Cr, As and Ag. |                |   | 1991-03-05   | 2007-03-06 | Kelson H C | EL3784 was a tenement which largely focussed on the Black Snake and Brown Snake historic workings. The primary focus of works was to clear the collapsed adits and shafts for the purposes of historic mining tourism. The efforts of the individual are noted in several newspaper clipping attached with reports. No assay samples were collected but dollying established the quartz was gold bearing. Tenement ultimately relinquished in 2007 after no work completed since 2004. |
| <b>Geology</b> | <ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul> | <ul style="list-style-type: none"> <li>EL 8574, EL 8800 &amp; EL 8692 are located within the New England Fold Belt (NEFB) of the Tasman Orogenic system. The NEFB is a complex tectonic collage of amalgamated, accreted and fault bound terranes which formed as part of the Tasman Orogenic system, a Cambrian to early Ordovician extensional accretionary orogen of Gondwana that can be divided into the following fault-bound terranes with differing tectonic environments: <ul style="list-style-type: none"> <li>Weraeraai Terrane: dismembered ophiolite sequence;</li> <li>Gamilaroi Terrane: early Devonian remnant intra-oceanic arc;</li> <li>Djungati Terrane: middle–late Devonian subduction complex;</li> <li>Anaiwan Terrane: lower–middle Devonian arc derived volcanoclastic sediments.</li> </ul> </li> <li>Both projects are truncated by the roughly N-S trending Peel Manning Fault System (PMFS). The PMFS is a major west-dipping fault zone, that extends over a length of 270 km and represents a major geological structure that juxtaposes geological terranes.</li> <li>Along the PMFS mineralisation includes gold, mercury, antimony, copper-gold, magnesite, and veins and podiform chromite.</li> <li>The exploration model for the Bingara and Nundle involves potential to host bulk tonnage, low-grade gold and fissure vein high grade gold deposits and volcanic hosted massive sulphide copper – gold – zinc deposits (Mother Lode Systems).</li> <li>Mother Lode style mineralisation is an orogenic gold subtype that resembles typical Archean orogenic gold deposits that are spatially</li> </ul> |            |            |  |

| <b>Balanced reporting</b>                 | <ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>   | <ul style="list-style-type: none"> <li>See “Cautionary Statement – Historic Data” in the main body of announcement</li> </ul>  |
| <b>Other substantive exploration data</b> | <ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul> | <p><b>Nundle</b></p> <ul style="list-style-type: none"> <li>A magnetics survey was completed by Geoterrex for Caledonian Pacific Minerals N.L in 1997 over the Folly Line. The survey used a cesium split-beam total magnetic sensor with a sampling interval of 0.1 seconds and an inflight sensitivity of 0.01 nT. A proton magnetometer with digital recording was operated continuously through acquisition with a sample interval of 5 second and sensitivity of 0.5 nT. The survey was re-processed by RAMA geophysics in 2020. A 3D inversion was completed using mGinv3D from Scientific Computing and Applications. The inversions were unconstrained.</li> </ul> <p><b>Barnard Hut &amp; Back Barb</b></p> <ul style="list-style-type: none"> <li>Copper mineralisation at these prospects was explored between 1970 and 1972 with limited surface mapping and reconnaissance trenching at Barnard Hut and trenching and an exploration adit at Back Barb. Additional exploration was carried out in 2008 which included project level airborne magnetics and a small soil grid over the Back Barb prospect.</li> <li>The initial phase of trenching work in 1971 included 376 channel samples from a series of trenches that targeted exposed zones of copper mineralisation in Barnard Hut. The report notes “strong traces of copper mineralisation over a strike length of approximately 2 miles” (approximately 3.2 kms). Assay results from the trenching indicate multiple zones of strong copper mineralisation over a length of 2,000 feet (approximately 610 m).</li> <li>See “<i>Exploration done by other parties</i>” for a detailed summary of exploration completed by other parties.</li> <li>A detailed summary of other substantive exploration data at Bingara</li> </ul> |
