

### HIGHLIGHTS

- ➔ Spargoville 5A Definitive Feasibility Study progressed
  - ➔ Bulk Sample performing as expected through Glencore's Murrin Murrin HPAL Plant
  - ➔ Both open pit and underground decline options have now been evaluated
  - ➔ Excellent hanging-wall stability observed in the trial slot within fresh-rock zone
  - ➔ Detailed engineering and geotechnical studies commencing
- ➔ Underground decline from the 5A Pit selected as the preferred mining method
  - ➔ Underground extraction offers less dilution of the high-grade to assist optimum product blending
  - ➔ Scheduling and capital/operating expenditure to complete DFS is near completion
  - ➔ Underground drill position to be established to test depth extensions of the 5A channel
  - ➔ Drill drive may be repurposed as a potential access drive to the 5D Andrews Mine

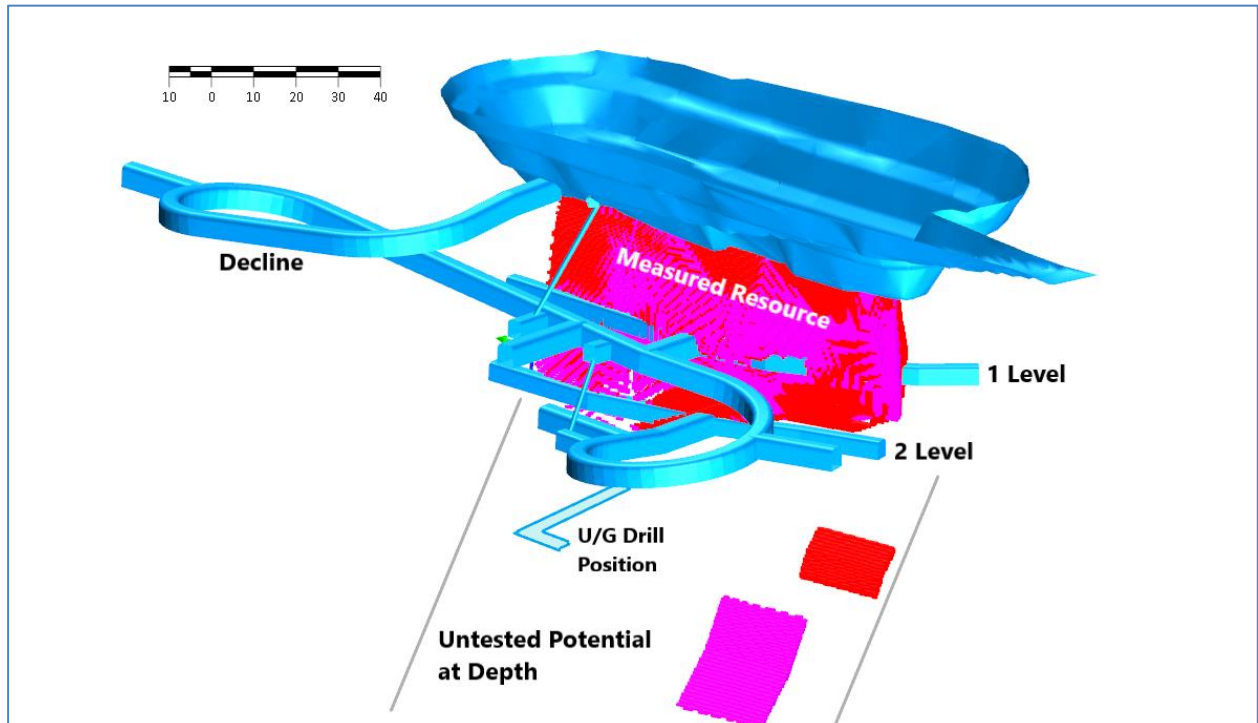

Figure 1: Conceptual 5A Decline Design with two levels and drill position shown

Estrella Resources Limited (ASX: ESR) (Estrella or the Company) is pleased to update the market on its Definitive Feasibility Study progress to restart the high-grade Spargoville 5A Nickel Mine, located approximately 20km Southwest of Kambalda.

Estrella Managing Director Chris Daws commented

***“With the successful delivery of the metallurgical sample to Glencore, Estrella has passed a very significant milestone on the way to getting the Spargoville Nickel Project into production.***

***Our greater understanding of the 5A hanging wall environment below the open pit has given us confidence to pursue the remaining high-grade nickel via the establishment of an underground exploration decline.***

***The reduced timeframe and smaller surface footprint will be beneficial both to the bottom line and to the environment.***

***The strength of the nickel price and strong outlook is a big positive for the 5A’s future development and I look forward to providing more details as we progress work.”***

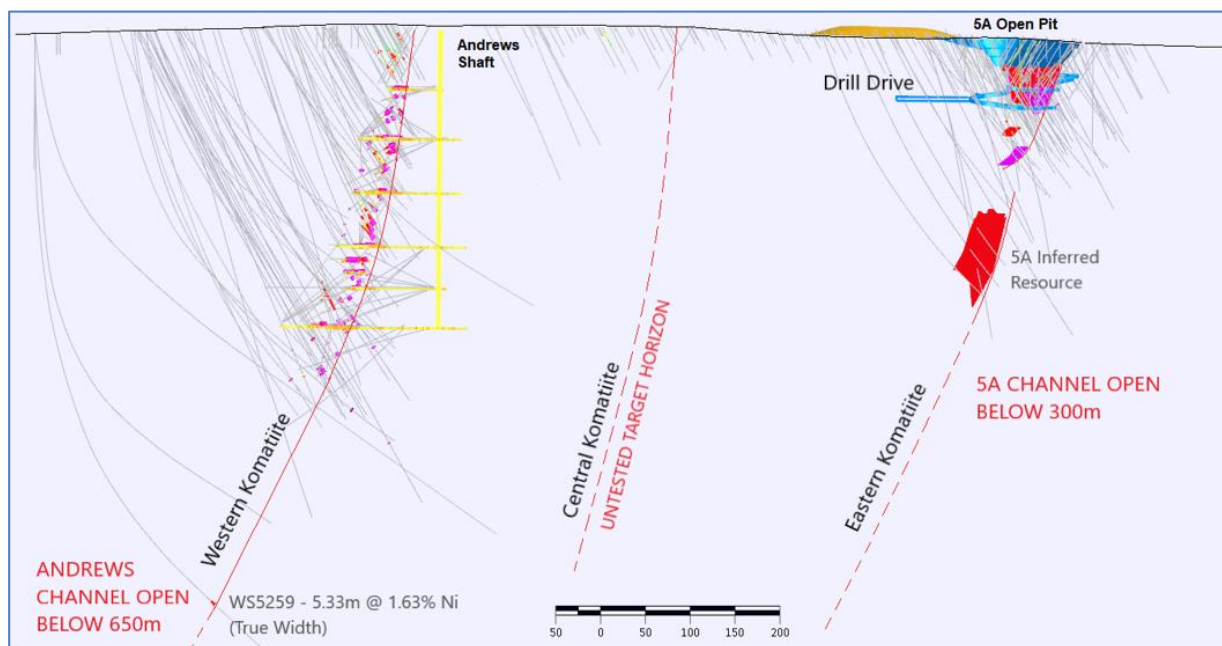

The Company is advancing the Spargoville 5A feasibility study, selecting to progress with an underground mining method after evaluation of this option against an open pit cut-back. The first-pass conceptual design, shown in Figure 1, was used for the evaluation. There are some clear advantages to underground mining which assist project economics and grade of ore produced when compared to the open pit cut-back option.

One example is that it enables the Company much more control over mining dilution, which in turn influences downstream crushing and blending of the ore to achieve a significantly higher-value product. The Company will be targeting the massive sulphide grading 7.8% nickel and a portion of the matrix and breccia sulphides will also be mined.

During the mining of the trial bulk sample, it was determined that excessive dilution of the high-grade ore could easily occur during open-pit blasting. The mining dilution comes from a competency difference between the weathered massive sulphides and relatively un-weathered ultramafic hanging wall and fresh basalt footwall. Dilution arising from these competency differences is more easily controlled with a targeted underground mining technique as opposed to open pit style blasting.

Other significant savings come from the reduced timeframe of the project as compared to the cut-back coupled with significantly lower environmental footprint. This is a preferred outcome for the Company, given the access road and a portion of the existing waste dump infrastructure would have to be moved if the pit cut-back was to be made. Through underground operations, the Company can limit surface works to areas that have already been disturbed by historical mining. The Company sees an underground mining technique as the best mining method to meet the outcomes intended for the project for it to be successful and has the smallest impact on the environment.

The Company will be establishing a footwall exploration drive from which the 5A komatiite channel can be explored at depth (see Figure 2). Underground drilling is expected to be much simpler and more cost effective than surface drilling, enabling faster production rates and a lower exploration cost. Estrella can also target the 5D Andrews Nickel Deposit which is approximately 500 metres to the west, along with the Central komatiite horizon that exists between Andrews and 5A. The Central Komatiite has received very little exploration in this area of the tenement despite being host to the 5B Deposit 1,200 metres to the South.

**Figure 2: Section between Andrews Shaft and 5A Open Pit showing the drill drive position and the untested Central Komatiite**

In the future the proposed drill drive could be repurposed to access the historic Andrews Mine without the need for further surface works.

Having selected the underground option, the Company is now conducting detailed scheduling, capital and operating expenditure analysis to complete the Definitive Feasibility Study.

The Company will keep shareholders updated as the process unfolds.

The Board has authorised for this announcement to be released to the ASX.

## **Competent Person Statement**

The information in this announcement relating to Exploration Results is based on information compiled by Steve Warriner, who is the Exploration Manager of Estrella Resources, and a member of The Australasian Institute of Geoscientists. Mr. Warriner has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resource and Ore Reserves". Mr. Warriner consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

## **Forward Looking Statements**

This announcement contains certain forward looking statements which have not been based solely on historical facts but, rather, on ESR's current expectations about future events and on a number of assumptions which are subject to significant uncertainties and contingencies many of which are outside the control of ESR and its directors, officers and advisers.

## APPENDIX 1 JORC TABLE 1 - JORC CODE, 2012 EDITION – TABLE 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond core is HQ sized. Core samples are quarter cut with one quarter sent to the lab for assay and three quarters kept frozen at Carr Boyd for metallurgical sampling. Sulphide determinations for visual estimates are assisted with the use of a handheld Bruker XRF.</li> </ul>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<ul style="list-style-type: none"> <li>All core is measured against actual drill depths and recovery calculated to ensure samples are representative. Core is cut perpendicular to sulphide/olivine layering.</li> </ul>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are material to the Public Report.</li> </ul>	<ul style="list-style-type: none"> <li>Intersections are visually assessed to determine oxide, transitional and fresh nickel mineral species. Handheld XRF assists in the identification of sulphide and arsenic levels.</li> </ul>
	<ul style="list-style-type: none"> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information</li> </ul>	<ul style="list-style-type: none"> <li>Nickel mineralisation consists of contact massive sulphides (pyrite, pyrrhotite, pentlandite, violarite, chalcopyrite) typically less than 1.5m thick, overlain by matrix sulphides and disseminated sulphides. At 5A the sulphides have been weathered to produce supergene sulphides of pyrite and violarite.</li> <li>Nickel and multielement analysis is performed by 4 acid digest and a combination of ICP-MS and ICP-OES analysis techniques. Gold and PGEs are determined by a fire assay fusion, followed by aqua regia digest and atomic absorption spectrometer (AAS) finish.</li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Diamond core is predominantly HQ triple tube to maximise recovery.</li> </ul>
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>All core is measured against actual drill depths and recovery calculated to ensure samples are representative and to identify core loss.</li> <li>Logs will include lithology, oxidation, mineral species, RQD, alteration and gangue mineral determination.</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Logging</i>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>Detailed drill hole logs are produced on 100% of the core as per current industry best practise. All core is photographed and all digital and paper records will be kept.</li> </ul>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>Core is ¼ cut for assay with the remaining ¾ stored in a freezer for metallurgical sampling.</li> <li>Procedures ensure the appropriateness of samples in line with this style of high-grade mineralisation.</li> <li>Standards and blanks have been inserted into the sample stream at a ratio of 20:1</li> <li>The size of the core is adequate for this style of mineralisation.</li> </ul>
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Standards and blanks are inserted into the sample stream at a ratio of 20:1</li> <li>Handheld XRF results are for internal use within the company and will not be published. A Bruker XRF instrument was recently purchased by the company.</li> </ul>
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> </ul>	<ul style="list-style-type: none"> <li>Significant intersections have been reviewed by alternative company personnel.</li> </ul>
	<ul style="list-style-type: none"> <li>The use of twinned holes.</li> </ul>	<ul style="list-style-type: none"> <li>Several of the current drillholes twin existing drilling. SPDD005 twins 5ADD002; SPDD009 twins 5ADD018; SPDD018 twins KWC0006.</li> </ul>
	<ul style="list-style-type: none"> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> </ul>	<ul style="list-style-type: none"> <li>Drill hole is captured into the LogChief digital system and later validated in 3D using Micromine. All core will be photographed and all digital and paper records will be kept.</li> </ul>
	<ul style="list-style-type: none"> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>No adjustments are necessary to assay data for this style of mineralisation.</li> </ul>
	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to</li> </ul>	<ul style="list-style-type: none"> <li>Surface topography is derived from drill hole</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Location of data points</i>	locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	collars and the historical mining pick-ups. Drill holes were set out using an RTK theodolite and final hole pickups will use DGPS or similar. <ul style="list-style-type: none"> <li>Initial drill hole line-ups will be controlled using a Reflex Azimuth Aligner and drillholes are surveyed using a Reflex North Seeking Gyro.</li> </ul>
