

6 December 2024

## FURTHER THICK REE/TREO INTERSECTIONS FROM SURFACE

### HIGHLIGHTS

- **All assays have now been received** from the Wabli Creek maiden drill campaign which **has confirmed consistent, thick Rare Earth Element (REE) mineralisation** hosted within the alkaline granite intrusion (biotite granite).
- Consistent high-grade zones of Magnet Rare Earth Oxide (MREO) (**Neodymium (Nd), Praseodymium (Pr), Dysprosium (Dy) & Terbium (Tb)**) intersections up to **1809ppm uncovered**.
- **Multiple holes mineralised at or close to surface.**
- Significant weathering along shear zones correlates with the highest grades of TREO up to 7193ppm and MREO up to 1809ppm.
- Large TREO resource potential.

### FINAL ASSAY RESULTS INCLUDE

- 24WCRC031: **76 metres\* at 1677 ppm TREO** from 4 metres depth, inc. **14m @ 2394 ppm TREO, 5m @ 2421 ppm TREO & 3m @ 4514 ppm TREO** and inc. **19 metres at 379 ppm MREO and 3 m @ 1087 ppm MREO**
- 24WCRC034: **68 metres at 1032 ppm TREO** from 12 metres depth
- 24WCRC040: **60 metres at 1077 ppm TREO (entire hole)**
- 24WCRC029: **57 metres at 1063 ppm TREO** from 1 metres depth
- 24WCRC038: **53 metres at 1057 ppm TREO** from 24 metres depth and inc. **2 metres at 508 ppm MREO**
- 24WCRC019: **52 metres at 1166 ppm TREO** from 48 metres depth, inc. **3m @ 1567 ppm TREO & 3m @ 1618 ppm TREO & 9 metres at 304 ppm MREO**
- 24WCRC030: **40 metres at 1534 ppm TREO** from 7 metres depth, inc. **3m @ 3200 ppm TREO & 7m @ 2850 ppm TREO & inc. 3 metres at 674 ppm & 7 metres at 689 ppm MREO**
- 24WCRC037: **23 metres at 1366 ppm TREO** from 13 metres depth, inc. **2m @ 3324 ppm TREO and 6m @ 1600 ppm TREO and inc. 5 metres at 448 ppm MREO & 4 metres at 298 ppm MREO**

\* Reference to metres @ XXXXppm is down-hole depth

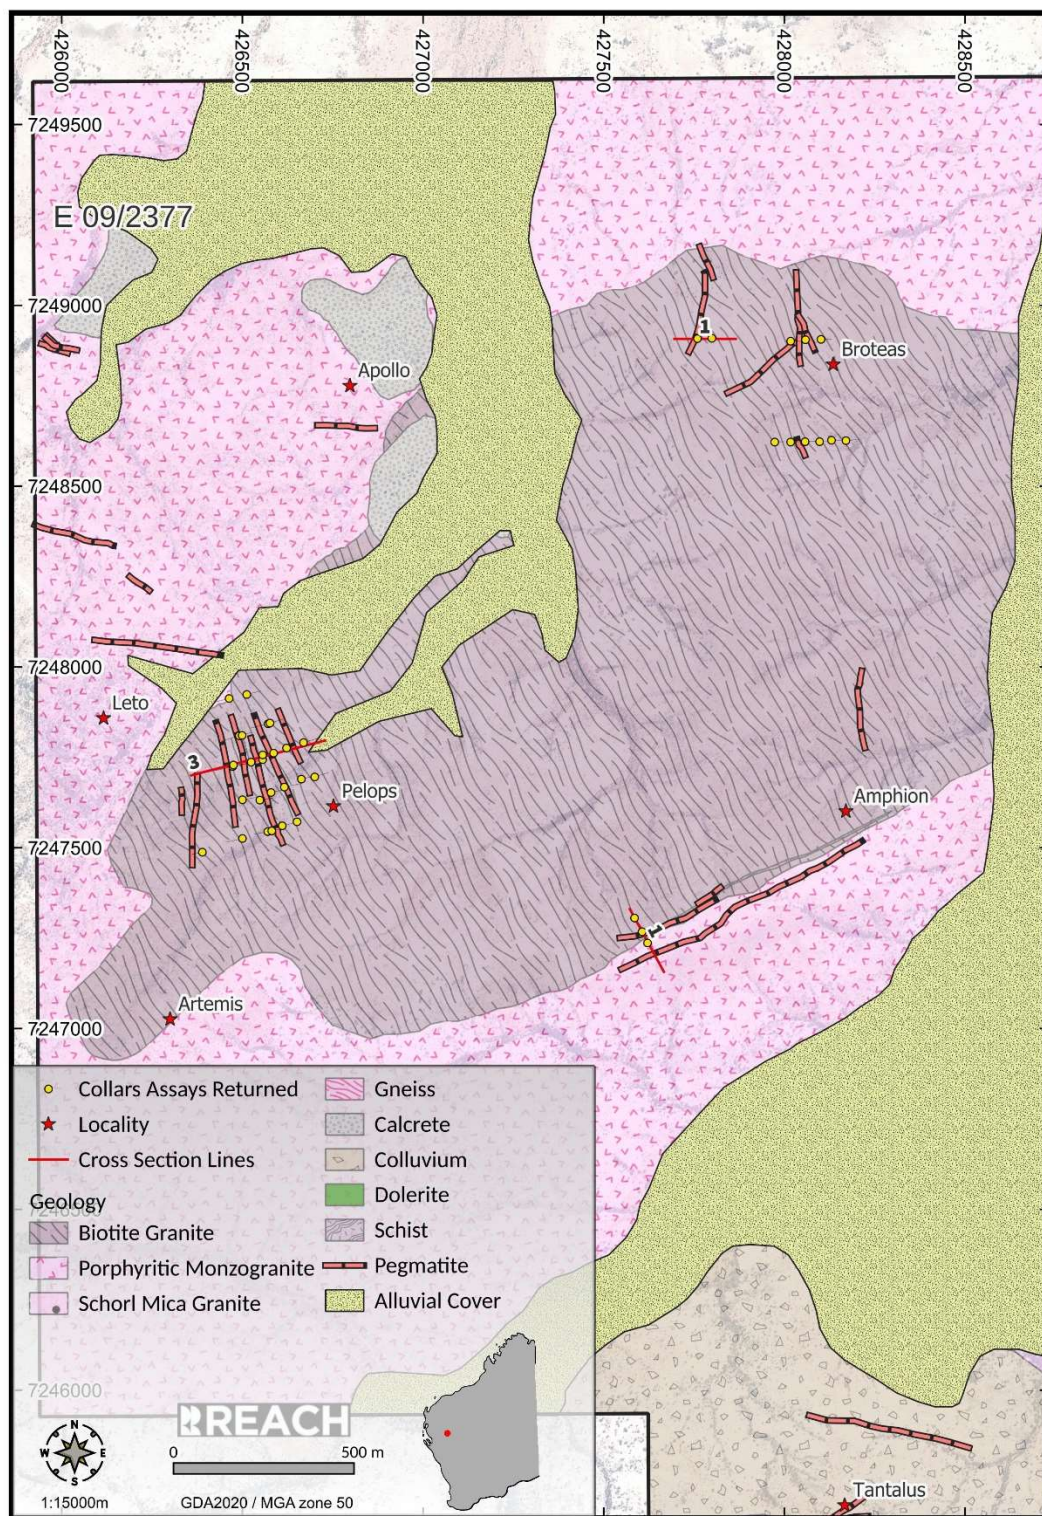

Figure 1. Wabli Creek Project – First phase drilling showing cross section lines

**Reach Resources Limited (ASX: RR1 & RR1O) (“Reach” or “the Company”)** is pleased to present assay results from the remaining samples analysed from drilling undertaken in October, at the Company’s 100% owned Wabli Creek Project in the Gascoyne, W.A (“the Project”).

A total of 40 holes were completed using Reverse Circulation (RC) drilling across three target areas Pelops, Broteas and Amphion within the large Alkaline Granite intrusion at Wabli Creek (Refer to Figure 1).

This announcement presents assay results from drill holes 24WCRC019 – 24WCRC040 and follows the results from drill holes 24WCRC001 – 24WCRC018, announced on 21 November 2024.

These latest assay results confirm further broad intersections of Total Rare Earth Oxides (TREO) over 1000ppm within the majority of holes in the biotite granite and a depletion of grades in the neighbouring granite and within pegmatites.

Drill holes 24WCRC030 and 24WCRC031 revealed high grades of TREO (7193 ppm) and MREO (1809 ppm), and importantly were concentrated within a highly weathered zone which is interpreted to be influenced by a shear zone with a steep eastward dip (Figure 3). Similar highly weathered zones have been identified elsewhere and are associated with elevated TREO and MREO values, suggesting the influence of hydrothermal fluids in the mineralisation of the Rare Earth Elements (REE). Notably, the presence of these high-grade zones, as seen in drill hole 24WCRC015, along line 3 in the Pelops area (Figure 2) could potentially enhance the overall REE concentrations in the biotite granite. This, in turn, may significantly improve the resource potential of the project.

The Amphion cross-section Line 1 traverses the contact zone between the biotite granite on the left side of the image and the porphyritic granite on the right, with a schist zone situated between them. Drill hole 24WCRC029, located within the biotite granite, shows near-complete mineralisation in TREO, while the other two drill holes, positioned within the schist and porphyritic granite, exhibit no significant mineralisation. This finding reinforces the interpretation that the biotite granite serves as the primary host rock and provenance for REE mineralisation in the area.

The Wabli Creek REE assays indicate similarities with globally significant deposits such as Torngat Metals Strange Lake Inferred Resource in Canada (<https://torngatmetals.com/news-and-media/>) and Red Metal Limited’s (ASX: RDM) Sybella Inferred Resource in Queensland (ASX Announcement 21 October 2024).

At Strange Lake, REE mineralisation is predominantly hosted within the peralkaline granites of the Strange Lake Intrusion. While higher-grade zones at Strange Lake are associated with flat-lying pegmatites, this is not the case at Wabli Creek. At Wabli Creek, high-grade mineralised zones occur in close proximity to pegmatites; however, the pegmatites themselves are internally depleted in REEs, indicating they are not the source of the mineralisation. Instead, the high-grade zones are likely formed by hydrothermal fluids migrating through shear zones, altering the host rock to clay and depositing REEs. At Strange Lake, the peralkaline granite also hosts a significant inferred resource.

Similarly, Red Metal Limited’s Sybella REE project in Queensland is hosted within alkaline granites spanning 12 km by 3 km, with high-grade zones localised within breccias.

The latest results returned from Wabli Creek, further confirm the strong consistency of mineralisation observed in the initial findings, highlighting the potential for additional high-grade MREO zones. This is particularly significant due to the importance of MREO elements such as Neodymium (Nd), Praesodymium (Pr), Dysprosium (Dy), and Terbium (Tb), which are essential for manufacturing permanent magnets used in electric vehicles and wind turbines. These elements also represent the most valuable components of the TREO basket.

Five samples have been sent to Intertek Genalysis for XRD analysis to further understand the mineralogy of the mineralisation.

CEO Jeremy Bower commented:

“The positive results from recent drilling efforts highlights the consistent REE mineralization found in the alkaline granite. The presence of significantly high grades of MREO within weathered zones is particularly promising. The results are encouraging, as multiple drill holes have confirmed that the mineralisation begins at or near the surface, which is advantageous for future exploration and for mining, should a mine be developed in the future.”

There is a high level of consistency in the TREO grades reported and whilst we don't know the extent of what we have here yet, this first round of drilling has returned some really interesting results.

During a time when western governments are providing significant funding and support for REE projects in countries such as Australia we look forward to getting an understanding of mineralogy in the coming weeks before we determine next steps in the exploration process for 2025”.

**About Reach Resources Limited**

Reach Resources is a critical mineral explorer with a large portfolio of tenements in the resource rich Gascoyne Mineral Field. Recent and historical exploration results have confirmed the presence of Lithium, REE, Niobium and Manganese across the Company's land holdings.

However, the Company is distinct from other pure explorers by also having an Inferred Gold Resource at Murchison South and an investment in a downstream patented technology that recycles the rare earth elements from the permanent magnets required in electric vehicles, wind turbines, hard disk drives and MRI machines (REEcycle Inc.).

**Competent Person's Statement**

Information in this announcement that relates to exploration results is based on and fairly represents information and supporting documentation prepared and compiled by Mr Nicholas Revell, who is a Member of the Australian Institute of Geoscientists. Mr Revell is a part time, consulting geologist for Reach Resources Limited. Mr Revell has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person, as defined in the 2012 Edition of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves. Mr Revell consents to the inclusion in the announcement of the matters based on this information in the form and context in which it appears.

**No New Information**

Except where explicitly stated, this announcement contains references to prior exploration results, all of which have been cross-referenced to previous market announcements made by the Company. The Company confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements.

**Forward Looking Statement**

This report contains forward looking statements concerning the projects owned by Reach Resources Limited. If applicable, statements concerning mining reserves and resources may also be deemed to be forward looking statements in that they involve estimates based on specific assumptions. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward looking statements as a result of a variety of risks, uncertainties and other factors. Forward looking statements are based on management's beliefs, opinions and estimates as of the dates the forward looking statements are made and no obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

## Appendix 1: Table 1 Wabli Creek - JORC 2012 Sampling Techniques and Data.

Criteria	JORC 2012 Explanation	Commentary
<b>Sampling Techniques</b>	<p>The nature and quality of sampling should be clearly defined, with specific reference to the techniques used, such as cut channels, random chips, or specialized industry-standard measurement tools that are suitable for the minerals being investigated. Examples of such tools include downhole gamma sondes or handheld XRF instruments. These examples should not be viewed as an exhaustive list, as the term "sampling" encompasses a wide range of methods depending on the type of exploration and the minerals targeted.</p> <p>It is essential to outline the measures taken to ensure the representativity of the samples, ensuring that they accurately reflect the mineralization present. This includes proper procedures for sample collection, handling, and processing. Additionally, all measurement tools or systems used must be appropriately calibrated to meet industry standards, and the calibration process should be clearly documented to confirm the reliability and accuracy of the data.</p> <p>The determination of mineralization, which is material to the public report, should also be included. In cases where standard industry methods are followed, a straightforward description may suffice, such as "reverse circulation drilling was used to obtain 1-meter samples, from which 3 kg was pulverized to produce a 30 g charge for fire assay." However, where more complex sampling challenges exist—such as with coarse gold that may present inherent sampling issues—additional details may be required to explain how these challenges were addressed. For unusual commodities or mineralization types, such as submarine nodules, more detailed information on the sampling methods should be disclosed to ensure the clarity and reliability of the report.</p>	<p><i>First phase drilling at Wabli Creek was sampled by an RC rig, using a cyclone and cone splitter into two calico bags, one was sent to the lab with the sample number printed on it, the other has the meter number written on it and stored in reserve. Each calico bag was put onto the same chute throughout the drilling program. Samples were collected at 1m intervals to collect a 2.5kg sample. The reject sample was collected by bucket and piled into rows of 10 or 20. 3013 samples from 40 drill holes were assayed for REE using the 48 element 4 acid digest exploration suite (4A/MS48; 4A/MS48R (FP6/MS33 for over range)) at Intertek labs Perth.</i></p>
	Include reference to measures taken to ensure representativity samples and the appropriate calibration of any measurement tools or systems used.	<i>Sampling for geochemical analysis was continuous down the length of each hole with 1 sample collected every meter. The cyclone was cleaned after every 6m rod. A geologist was supervising drilling at all times. The calico bag sent for assay was placed on the same chute on the cone splitter throughout the program.</i>
	Aspects of the determination of mineralisation that are Material to the Public Report.	<i>Significant mineralisation is determined by comparisons with other alkaline granite hosted REE deposits and the potential volume – see the significant intercept table.</i>
<b>Drilling Technique</b>	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	<i>A truck mounted RC percussion rig (OX SR 72) was utilised from surface to end of hole. This rig was used to drill all 40 drill holes. All RC holes were down-hole surveyed at 30-meter intervals using a North Seeking Gyro. Holes were drilled at -50° or -60° and aligned using a sighting compass.</i>
<b>Drill Sample Recovery</b>	Method of recording and assessing core and chip sample recoveries and results assessed.	<i>Sample recoveries were visually assessed and documented for each meter. Those few samples with poor recovery, commonly at the first three meters of the hole were added to with a spear sample, these were marked in the log.</i>
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	<i>The cyclone and sample return hose were cleaned and cleared after every rod. Sample recovery was monitored by the geologist per meter interval. Sample recovery was excellent overall.</i>
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	<i>No sample recovery bias is observed, mineralisation is broadly homogenous in the granite.</i>

<b>Logging</b>	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.  Whether logging is qualitative or quantitative in nature.	<i>Qualitative codes and descriptions were used to record geological data such as lithology, weathering, regolith, colour, chip percentage, texture, alteration, veins, minerals, prior to sampling. Radiation was quantitatively measured per meter in Bq/cm2</i>
	Core photography	<i>Chip trays are photographed.</i>
	The total length and percentage of the relevant intersections logged.	<i>The total lengths of all holes have been geologically logged.</i>

<b>Criteria</b>	<b>JORC 2012 Explanation</b>	<b>Commentary</b>
<b>Sub-sampling techniques and sample preparation</b>	If core, whether cut or sawn and whether quarter, half or all core taken.	<i>No core was collected.</i>
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	<i>All pulp samples were prepared with standard crush then pulverisation techniques at Intertek Maddington (methods SP91, SP05 (for samples over 3kg)</i>
	Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.	<i>No sub sampling was done</i>
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	<i>A total of 77 field duplicate samples were inserted through the assay batch at a rate of about 1 in 40 samples or 2.5% of the total samples. Duplicate performance is yet to be determined.</i>
	Whether sample sizes are appropriate to the grain size of the material being sampled.	<i>Crystal size of the granite is broadly uniform in the biotite granite 1-3mm. Samples were cone split to ensure even distribution of grain sizes. 2.5-3kg samples are appropriate for this grain size.</i>
<b>Quality of assay data and laboratory tests</b>	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	<i>All 3013 samples were sent to Intertek Genalysis for analysis of REE's and Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Fe, Ga, Gd, Ge, Hf, Ho, In, K, La, Li, Li-Rp1, Lu, Mg, Mn, Mo, Na, Nb, Nd, Ni, P, Pb, Pr, Rb, Re, S, Sb, Sc, Se, Sm, Sn, Sr, Ta, Tb, Te, Th, Ti, Tl, Tm, U, V, W, Y, Yb, Zn, Zr using Method Multi-acid digest including Hydrofluoric, Nitric, Perchloric and Hydrochloric acids in Teflon Tubes. Analysed by Inductively Coupled Plasma Mass Spectrometry</i>
	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	<i>Radiative isotopes of Y/Sr 90 were measured in Bq/cm2 using a Radeye B20 for every meter interval. The device was placed on the reject sample for 20 seconds, before the reading was recorded in the log.</i>
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	<i>A total of 76 certified reference standards, and 63 blanks were inserted evenly throughout the assay batch and at mineralised zones determined by the geologist. In addition to this, Intertek Genalysis has also included standard, duplicates and blanks to monitor the performance of the laboratory. The QAQC analysis is yet to be completed.</i>
<b>Verification of sampling and assaying</b>	The verification of significant intersections by either independent or alternative company personnel.	<i>Results reviewed by the Principal Geologist, the CEO and board personnel.</i>
	The use of twinned holes.	<i>No holes have been twinned</i>

	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Primary data is stored both in its source electronic form. Assay data is retained in both the original certificate (.pdf) form, where available, and the csv files received from the laboratory. Primary data was entered in the field into a portable logging device using standard drop-down codes. At this early stage, text data files are exported and stored in a database on the company server which is backed-up to cloud-based storage each day. Micromine software is used to check and validate drill-hole data.
	Discuss any adjustment to assay data.	Rare earth elements are reported as the elemental concentration. The rare earth elements were converted to the industry standard rare earth oxide format using the conversion factors available below which are based on the molar mass of each rare earth oxide.  Rare earth abbreviations typically used in industry reporting and throughout this report were: REE - Rare Earth Elements, value presented as elemental assay. REO - Rare Earth Oxides, value presented as oxide assay.

Criteria	JORC 2012 Explanation	Commentary
		<p>TREE - La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y and Sc.  MREE - Pr, Nd, Tb, Dy.  LREE - La, Ce, Pr, Nd and Sm.  HREE - Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y. HREO is calculated by adding together Y<sub>2</sub>O<sub>3</sub>, Tb<sub>4</sub>O<sub>7</sub>, Dy<sub>2</sub>O<sub>3</sub>, Ho<sub>2</sub>O<sub>3</sub>, Er<sub>2</sub>O<sub>3</sub>, Tm<sub>2</sub>O<sub>3</sub>, Yb<sub>2</sub>O<sub>3</sub>, Lu<sub>2</sub>O<sub>3</sub>, LREO is calculated by adding together La<sub>2</sub>O<sub>3</sub>, CeO<sub>2</sub>, Pr<sub>6</sub>O<sub>11</sub>, Nd<sub>2</sub>O<sub>3</sub>, Sm<sub>2</sub>O<sub>3</sub>  TREE is calculated by adding all the REO.</p>
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	The collar positions were surveyed by Handheld GPS using GDA2020, Zone 50 datum. GPS locations are accurate to ~3m.
	Specification of the grid system used.	GDA2020 Zone 50 datum.
	Quality and adequacy of topographic control.	Relative level was recorded from the GPS
Data spacing and distribution	Data spacing for reporting of Exploration Results.	Due to the potentially localized nature of the mineralisation initially hypothesized to be in association with pegmatites the drill hole spacing was set at 40m and locally adjusted to intercept the pegmatites. The drill line spacing was set at 100m at Pelops and 300m at Amphion and Broteas
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The drill spacing is sufficient to establish the degree of geological and grade continuity appropriate for an early-stage resource estimation.

	Whether sample compositing has been applied.	<i>Sample compositing was not applied</i>
--	--	---

Criteria	JORC 2012 Explanation	Commentary
<b>Orientation of data in relation to geological structure</b>	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	<i>Drill orientation was set to intercept pegmatites perpendicular to their strike. In Pelops the strike of the pegmatites on average 165° but the dip was unknown. The holes were planned at an azimuth of 255° and changed to 075° after it was determined the dip is to the SW. In Amphion the drill hole azimuth was set to 150° and in Broteas 090° and 270° which successfully intercepted the pegmatite as perpendicular as is practicable. Dip was either -50° or -60° increasing the chance of near perpendicular interception of pegmatites.</i>
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	<i>No significant sampling bias has been found so far. Drill holes were drilled approximately perpendicular to known structures.</i>
<b>Sample security</b>	The measures taken to ensure sample security.	<i>Samples were packed into polyweave bags immediately after logging and cable tied shut. The samples were then put into bulka bags at the end of the day. Bulka bags were freighted to Intertek labs using private courier.</i>
<b>Audits or reviews</b>	The results of any audits or reviews of sampling techniques and data.	<i>No external audits or reviews have yet been completed</i>

#### Appendix 1: Table 2 Wabli Creek - JORC 2012 Reporting of Exploration Results

Criteria	JORC 2012 Explanation	Commentary
<b>Mineral tenement and land tenure status</b>	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	<i>Wabli Creek drilling is located within E09/2377 situated in the Gascoyne, 30km southeast of Yinnetharra Station. E09/2377 100% by Reach Resources Ltd.</i>
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	<i>E09/2377 is 100% owned by Critical Elements Pty Ltd which is a wholly owned subsidiary of Reach Resources Ltd.</i>
<b>Exploration done by other parties</b>	Acknowledgment and appraisal of exploration by other parties.	<i>No previous drilling by other parties has been directed towards REE, however U308 Ltd explored for uranium from 2007 and 2011, Avocet Resources Ltd also explored for uranium from 2012 – 2013 and Mineral developments Pty Ltd explored for Beryl, Lithium, REE collecting rock chip samples, reviewing data but no drilling.</i>
<b>Geology</b>	Deposit type, geological setting and style of mineralisation.	<p><i>The Mount Phillips area in the Gascoyne Province showcases a complex geological history spanning the Archaean to Phanerozoic eons. The Archaean biotite gneiss, over 2.5 billion years old, forms the basement rock. Proterozoic sediments underwent deformation and metamorphism during orogenic events, forming the Morrissey Metamorphic Suite (1.8–2.0 billion years ago). Late Proterozoic fluvial sediments in the Mount James Formation and Bangemall Basin were deposited in grabens and folded terrains. The Phanerozoic Carnarvon Basin, with sediments younger than 541 million years, unconformably overlies older rocks, reflecting ongoing tectonic activity and faulting into the Phanerozoic.</i></p> <p><i>The granites in E09/2377 and surrounding are alkaline granites with a potential for REE, gems, tantalum, niobium and uranium. The nature of the mineralisation is in the process of being determined, however, preliminary analysis indicates broad REE enrichment in the alkaline granite with possible local enrichment associate with some pegmatites.</i></p>

Criteria	JORC 2012 Explanation	Commentary
<b>Drill hole Information</b>	A summary of all information material to the understanding of the exploration results including a tabulation of survey information for all Material drill holes:	<i>Refer to the tables in this announcement</i>
<b>Data aggregation methods</b>	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	<i>No data aggregation methods have been applied</i>
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	<i>No metal equivalent values have been applied</i>
<b>Relationship between mineralisation widths and intercept lengths</b>	These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	<i>At this stage of exploration insufficient data exists to confidently estimate a relationship between mineralisation widths and intercept widths. However, the mineralisation is so far understood to be massive mineralisation in the granite host rock of which the extents are not known with narrower zones of high-grade material. In the case of drill holes 24WCRC030 and 31 it is understood these drill holes intercepted the mineralised structure approximately perpendicular and the widths are expected to be approximately true widths.</i>
<b>Diagrams</b>	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	<i>Cross sections of significant zones and a plan view map showing these sections are given in this announcement.</i>
<b>Balanced reporting</b>	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	<i>See text and tables to this announcement</i>
<b>Other substantive exploration data</b>	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater,	<i>Petrological study of surface samples show the presence of monazite, zircon and trace pyrochlore. Monazite is thought to be the mineral responsible for the REE concentrations as other REE minerals have not been identified to this point. Zircon exists as an accessory mineral. Thorium is elevated in the alkaline granite giving readings typically between 0.9 and 1.1 Bq/cm2.  No density or metallurgical testing has been conducted</i>

Criteria	JORC 2012 Explanation	Commentary
	geotechnical and rock characteristics; potential deleterious or contaminating substances.	
Further work	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	<i>Geochemical analysis and XRD analysis will be undertaken in the coming weeks</i>

**DRILL COLLAR INFORMATION - SEE NEXT PAGE FOR ASSAY RESULTS**
