2017 Update – Strong Drilling Results Continue

- Cobalt Blue Holdings Limited (ASX:COB) is pleased to provide an update on its recently completed 1H 2017 resource definition drilling program at Thackaringa, NSW.
- Results support potential for significant enhancement of Mineral Resource.
- Results support potential to enhance the average grade within the overall mineralised envelope.
- The current announcement summarises assay results received year to date from seven diamond drill (DD) holes (1,011 metres total) and 24 reverse circulation (RC) holes (2,801 metres total) within the Railway, Pyrite Hill and Big Hill deposits. COB will announce results from the remaining seven DD and 14 RC holes on completion of the assay process.
- Current assay results continue to define a broad mineralised envelope and confirm the Thackaringa project as a significant cobalt-pyrite deposit.
- At **Railway**, current assays confirm high-grade intersections of mineralisation within a wide and continuous envelope. Best mineralised intercepts include:
 - **Drillhole 17THD06** – 46m @ 1,136ppm Co, 11.4% S and 10.1% Fe from 39m;
 - **Drillhole 17THR001** – 36m @ 1,075ppm Co, 10.6% S and 10.4% Fe from 27m;
 - **Drillhole 17THR005** – 20m @ 1,053 ppm Co, 12.8% S and 12.6% Fe from 52m;
 - **Drillhole 17THR008** – 41m @ 1,319ppm Co, 12.2% S and 11.2% Fe from 37m; and
 - **Drillhole 17THR011** – 53m @ 1,116ppm Co, 12.0% S and 10.9% Fe from 30m
- At **Pyrite Hill** assays confirm the mineralisation within the host lithology. Best mineralised intercepts include:
 - **Drillhole 17THD01** – 89m @ 982ppm Co, 9.4% S and 8.7% Fe from 34m;
 - **Drillhole 17THR016** – 49m @ 1,096ppm Co, 12.9% S and 13.4% Fe from 66m;
 - **Drillhole 17THR017** – 58m @ 1,383ppm Co, 13.2% S and 12.8% Fe from 54m; and
 - **Drillhole 17THR021** – 20m @ 1,204ppm Co, 13.1% S and 12.7% Fe from 44m.
- Best mineralised intercepts at **Big Hill** include:
 - **Drillhole 17THR013** – 54m @ 888ppm Co, 5.4% S and 5.0% Fe from 19m drill depth.

Cobalt Blue Holdings Limited is delighted to announce the completion of its 1H 2017 resource definition drilling program at the Thackaringa cobalt project, west of Broken Hill, NSW. Completion of this campaign is a major milestone. The current assay will be used as the basis for a new and updated resource estimation process, commencing in May.

This announcement summarises the assays from a total of thirty one (31) drill holes completed for a total of 3,812 metres. Break-down of drilling by deposit:

Deposit	Reverse Circulation Drilling		Diamond Drilling	
	No. Drill holes	Metres	No. Drill holes	Metres
Pyrite Hill	9	930	3	352
Big Hill	3	314	2	219
Railway	12	1,557	2	440
Total	24	2,801	7	1,011

Drilling to date has focussed on the higher priority Railway and Pyrite Hill areas which together contribute 95% of the existing Inferred Mineral Resource inventory of **33.1Mt at 833ppm Co** (reference COB Replacement Prospectus released 31 January 2017).

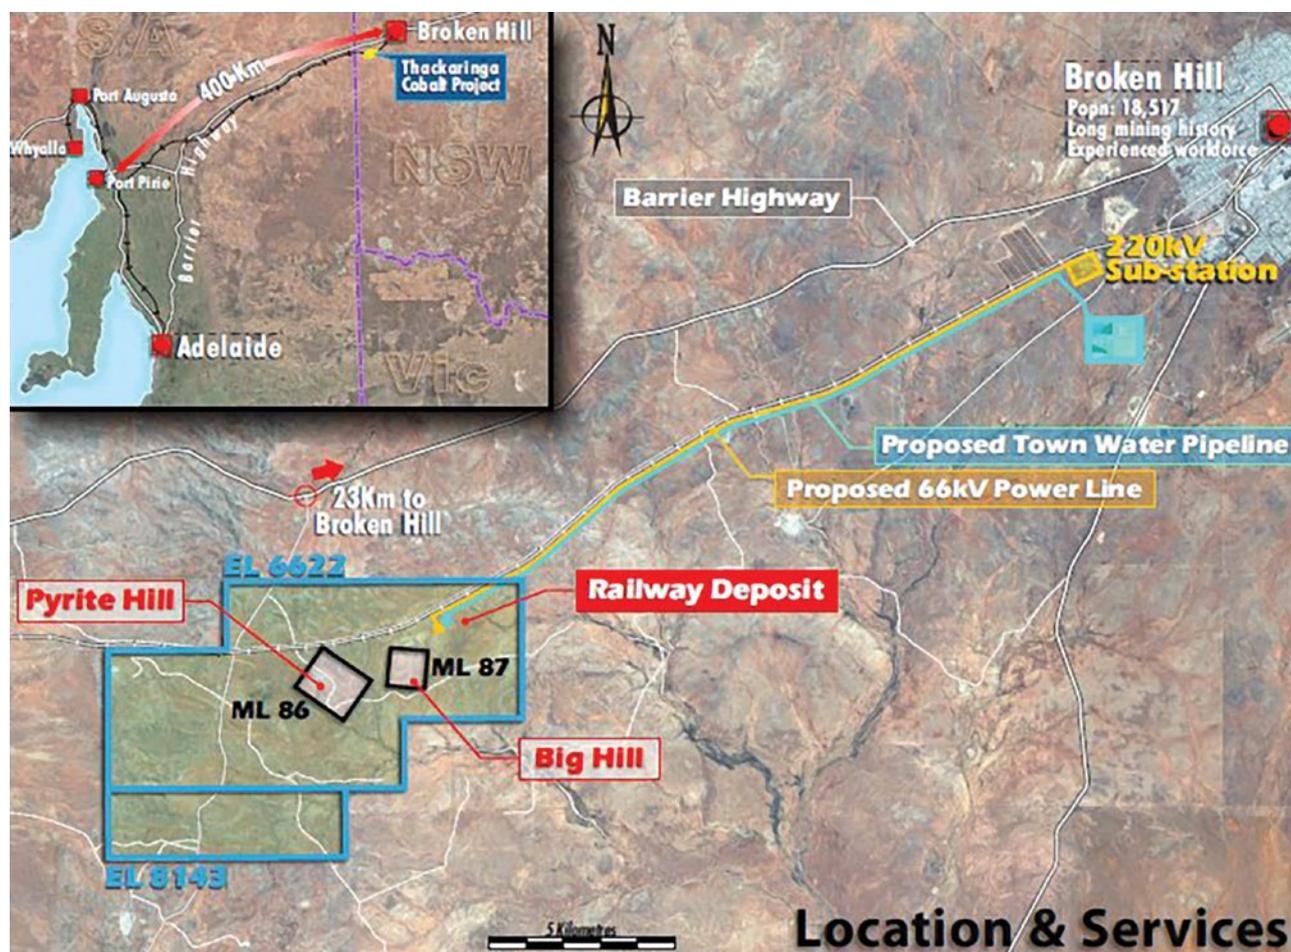

Figure 1: Cobalt Blue tenements, location and current/proposed infrastructure

Following the Company's stated accelerated exploration strategy, the 1H 2017 drilling program was completed by three drill rigs (one diamond and two reverse circulation). Inclined drill holes (between 40° and 60°) were designed to intersect the steeply dipping deposits at an optimal orientation. Drill results continue to confirm the predictive geological model.

The Thackaringa deposits have a combined strike length of over 4.5 kilometres varying from 25 to 100 metres width. Significant local thickening of the mineralised envelope is due to the extensive development of isoclinal folding within the host lithology unit. Initial interpretation of 2017 data suggests that this deformation may locally enhance cobalt and pyrite grade. This new structural information provides a further opportunity to define high grade lenses within the broader mineralised envelope. At Railway, zones of high grade cobalt mineralisation were intersected in the hanging wall of the deposit and demonstrate strong continuity.

Drilling undertaken to date has focussed on the shallow mineralisation – to approximately 150 metres below surface with confirmed mineralisation to greater depths. Mineralisation at all three of the deposits remains open down-dip. In addition to potential depth extension, discrete pods of mineralisation mapped within the footwall at Railway deposit were intersected by drilling and offer additional footwall exploration potential. The JV technical team is currently finalising geological modelling to further guide the pending revision of the Mineral Resource Estimate. This process will begin in May 2017, on delivery of the final batch of assay results. Further technical studies are continuing in parallel as the Company remains on schedule to deliver the Scoping Study by mid-2017.

Field operations continue with rehabilitation of drill sites and preparations for the forecast commencement of baseline environmental and hydrological monitoring.

Cobalt Blue Chairman, Robert Biancardi commented:

“COB is delighted with the timely and efficient conclusion to the drilling program. Preliminary interpretation of the results supports the Company's belief that the Thackaringa JV is defining a world class cobalt-pyrite deposit. We remain confident that data acquired during the 2016 and 2017 drilling programs will allow a significant enhancement in the estimated Mineral Resource. Initial indications also suggest that recent work has enhanced the average grade within the overall mineralised envelope.”

Further results will be forthcoming from the final assay samples presently being processed, which should be available for market release by the beginning of June. The 2017 program comprised a significant RC program designed to improve drilling density in support of a forthcoming update of the Mineral Resource estimation; and a Diamond Drilling program which – like the 2016 program – will provide ROM material for metallurgical testwork.

Railway

The Railway deposit is an elongated outcrop of mineralisation within a high-grade metamorphic host rock. The pyrite-quartz-albite gneiss mineralised lithology has a total strike length of some 3,000 metres, continuing in a south-west arc to the Big Hill deposit, which is offset by faulting (Figure 2).

Drilling at Railway comprised eight DD holes for a total of 1,126m and 23 RC holes for a total 3,053m. The program was designed to close the spacing between holes to allow a re estimation of the existing Mineral Resource.

The latest drilling assays confirm previous exploration results of high-grade cobalt and pyrite mineralisation. Assays from Railway confirm broad, continuous zones of cobalt and pyrite mineralisation significantly higher than the average resource grade (Figure 3).

Railway Results

Assays at Railway Trend confirm high grade intersections of mineralisation within a wide and continuous envelope. Best mineralised intercepts include:

- **Drillhole 17THD06** – 46m @ 1,136ppm Co, 11.4% S and 10.1% Fe from 39m drill depth
- **Drillhole 17THR001** – 36m @ 1,075ppm Co, 10.6% S and 10.4% Fe from 27m drill depth
- **Drillhole 17THR005** – 20m @ 1,053 ppm Co, 12.8% S and 12.6% Fe from 52m drill depth
- **Drillhole 17THR008** – 41m @ 1,319ppm Co, 12.2% S and 11.2% Fe from 37m drill depth
- **Drillhole 17THR011** – 53m @ 1,116ppm Co, 12.0% S and 10.9% Fe from 30m drill depth

These results confirm the previous tenor and elevated grade of cobalt-pyrite mineralisation along the defined strike length. Mineralisation at Railway remains open along strike and down-dip, boosting the potential for an open pit resource.

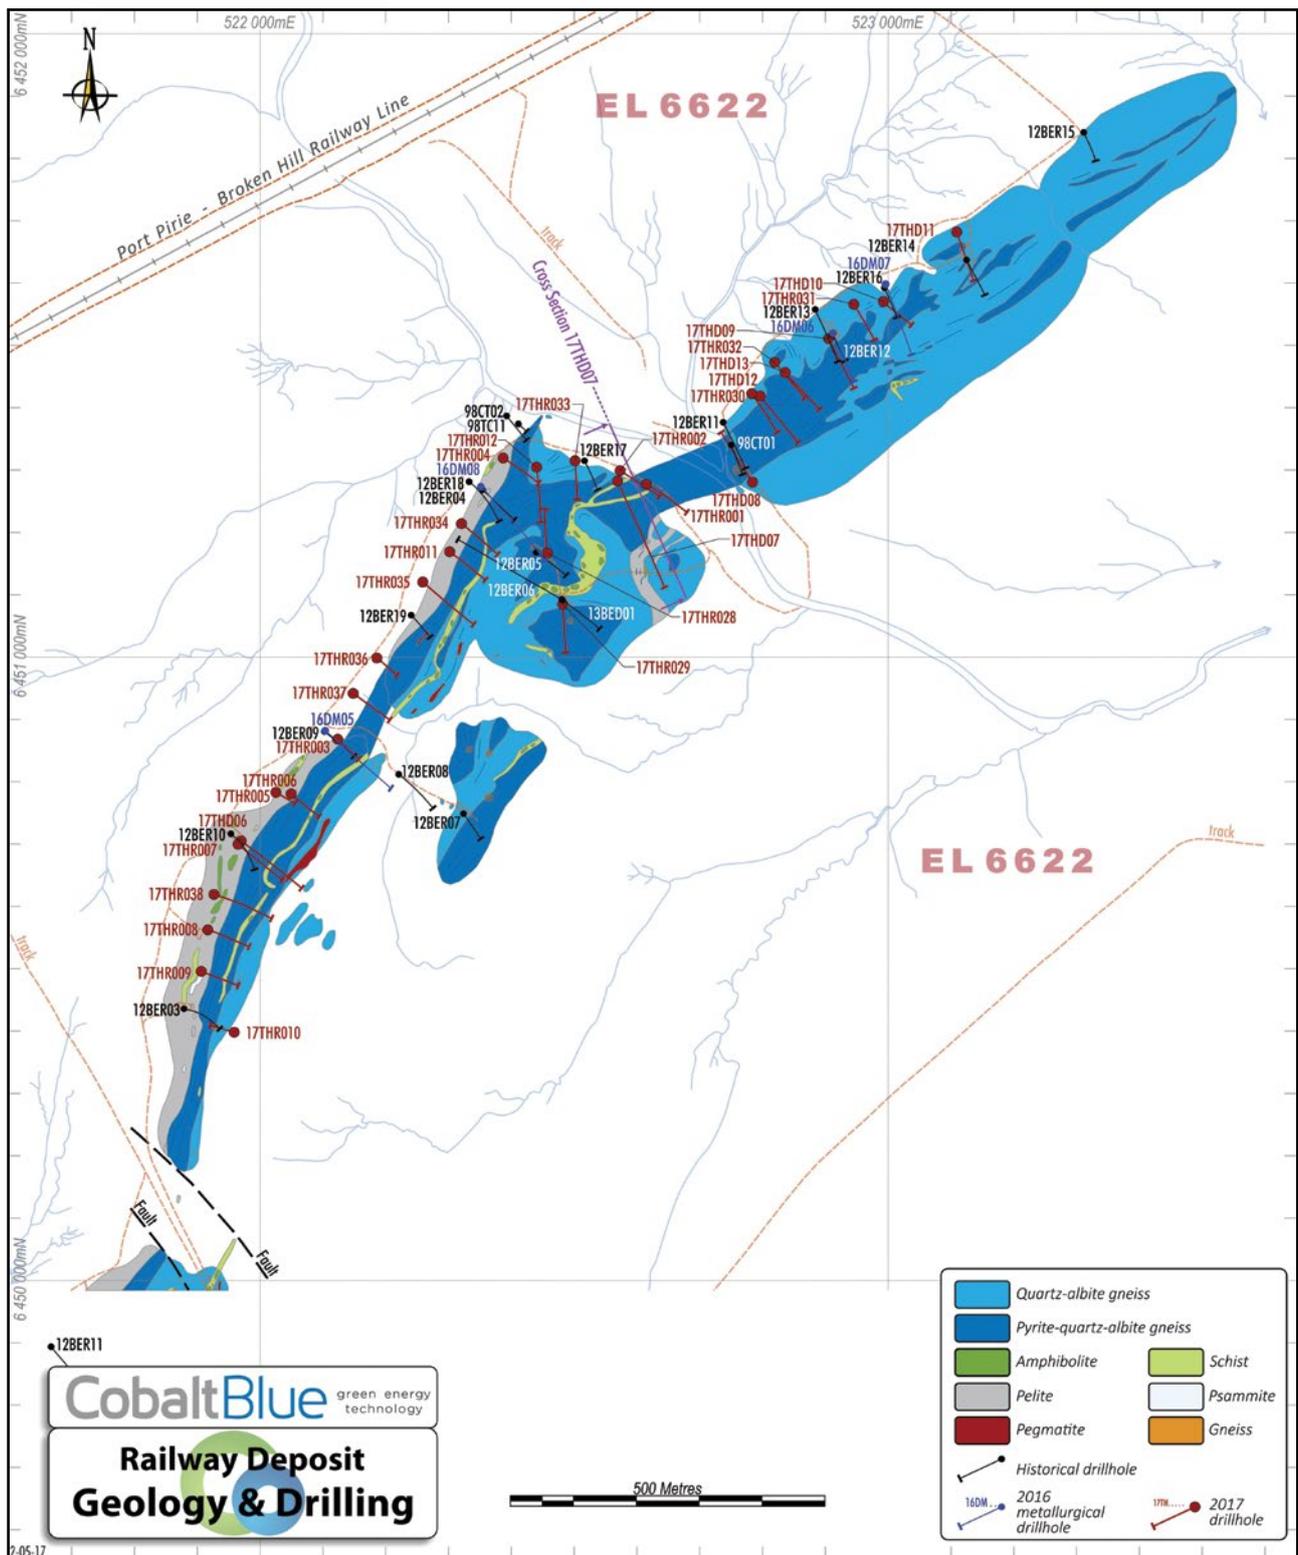

Figure 2: Plan view of Railway Deposit

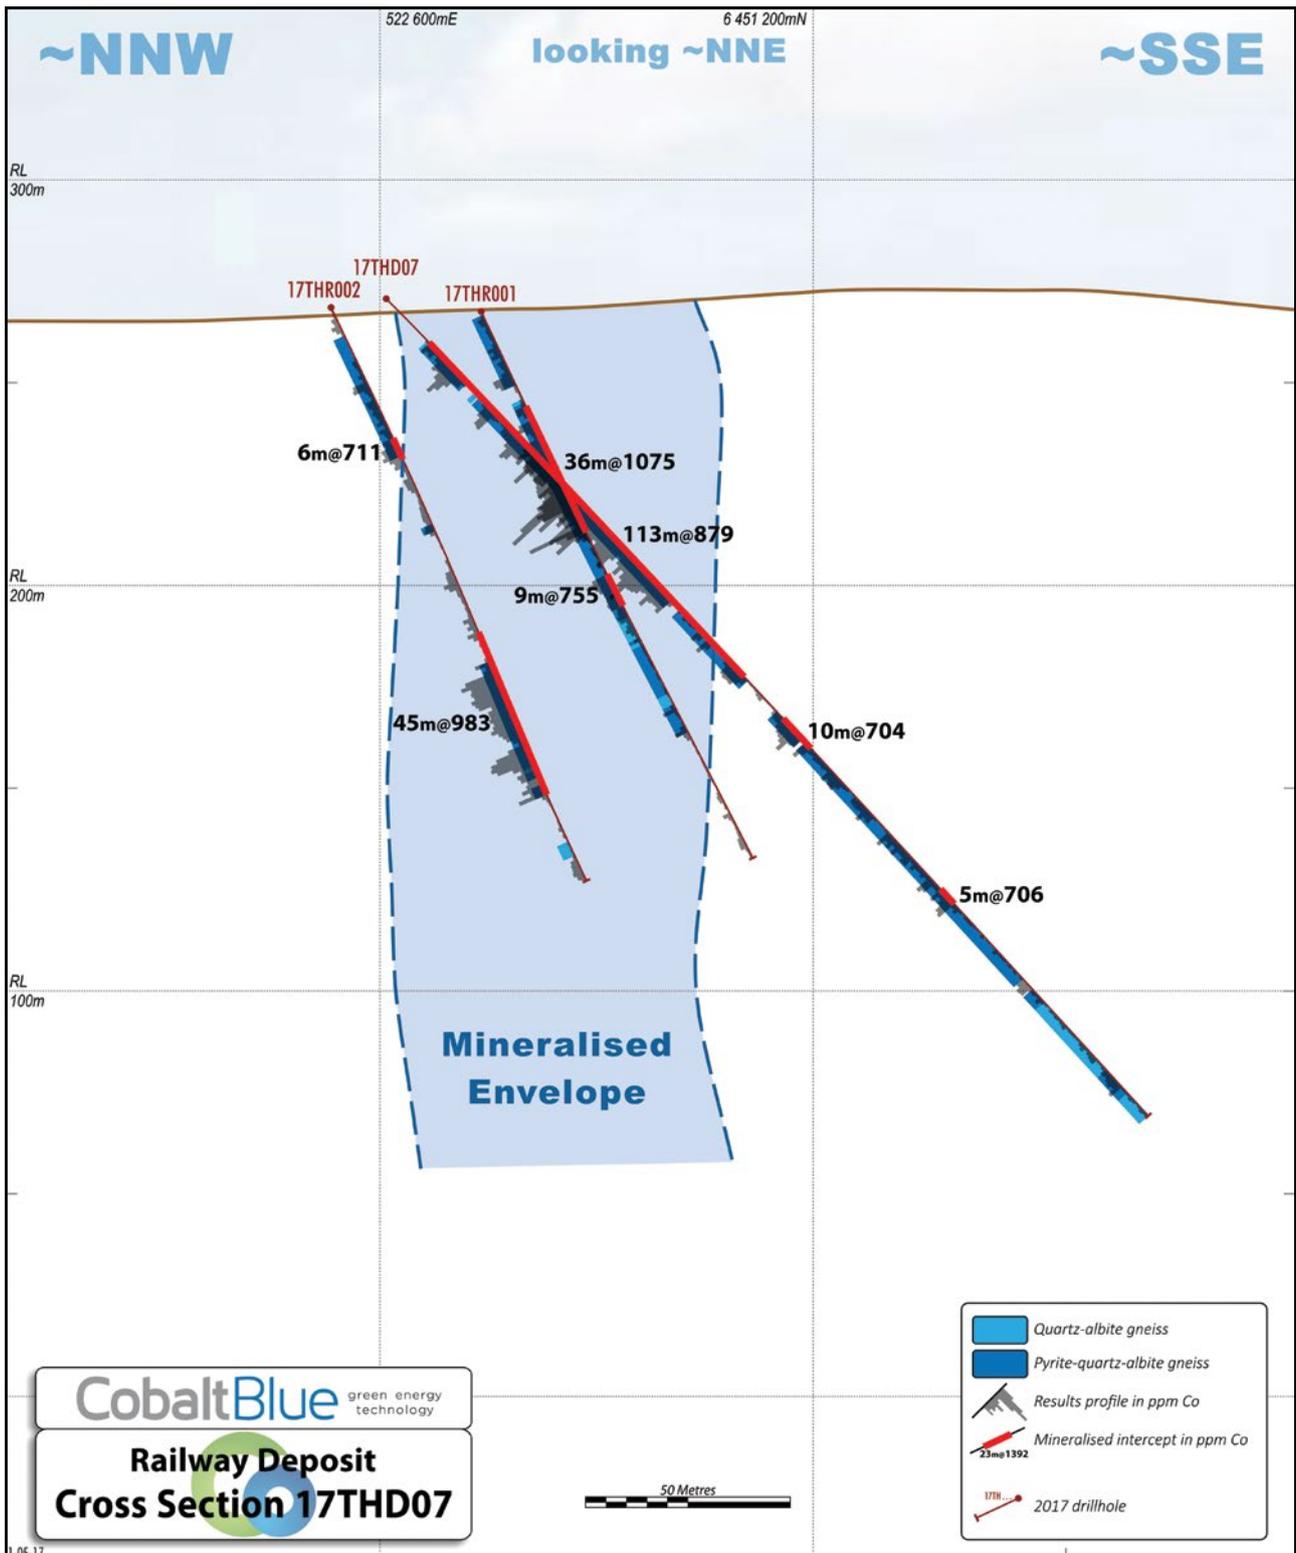

Figure 3: Railway X-section along plane of 17THD07

Pyrite Hill

The Pyrite Hill deposit is hosted within an extensively metamorphosed pyrite-albite-quartz gneiss. The deposit has a strike length of 1,200m and dips moderately to the east (Figure 5).

The drilling at Pyrite Hill comprised four DD holes for a total of 451m and 12 RC holes for a total 1,308m. The RC program was designed to close the spacing between existing holes to allow recalculation of the Mineral Resource; the DD program comprised holes to twin existing RC holes and to provide material for metallurgical testwork.

Pyrite Hill results

At Pyrite Hill assays confirm the down-dip mineralisation within the host lithology. Best mineralised intercepts include:

- **Drillhole 17THD01** – 89m @ 982ppm Co, 9.4% S and 8.7% Fe from 34m drill depth;
- **Drillhole 17THR016** – 49m @ 1,096ppm Co, 12.9% S and 13.4% Fe from 66m drill depth;
- **Drillhole 17THR017** – 58m @ 1,383ppm Co, 13.2% S and 12.8% Fe from 54m drill depth; and
- **Drillhole 17THR021** – 20m @ 1,204ppm Co, 13.1% S and 12.7% Fe from 44m drill depth;

Figure 4: Logging – Thackaringa Diamond Drilling Cores

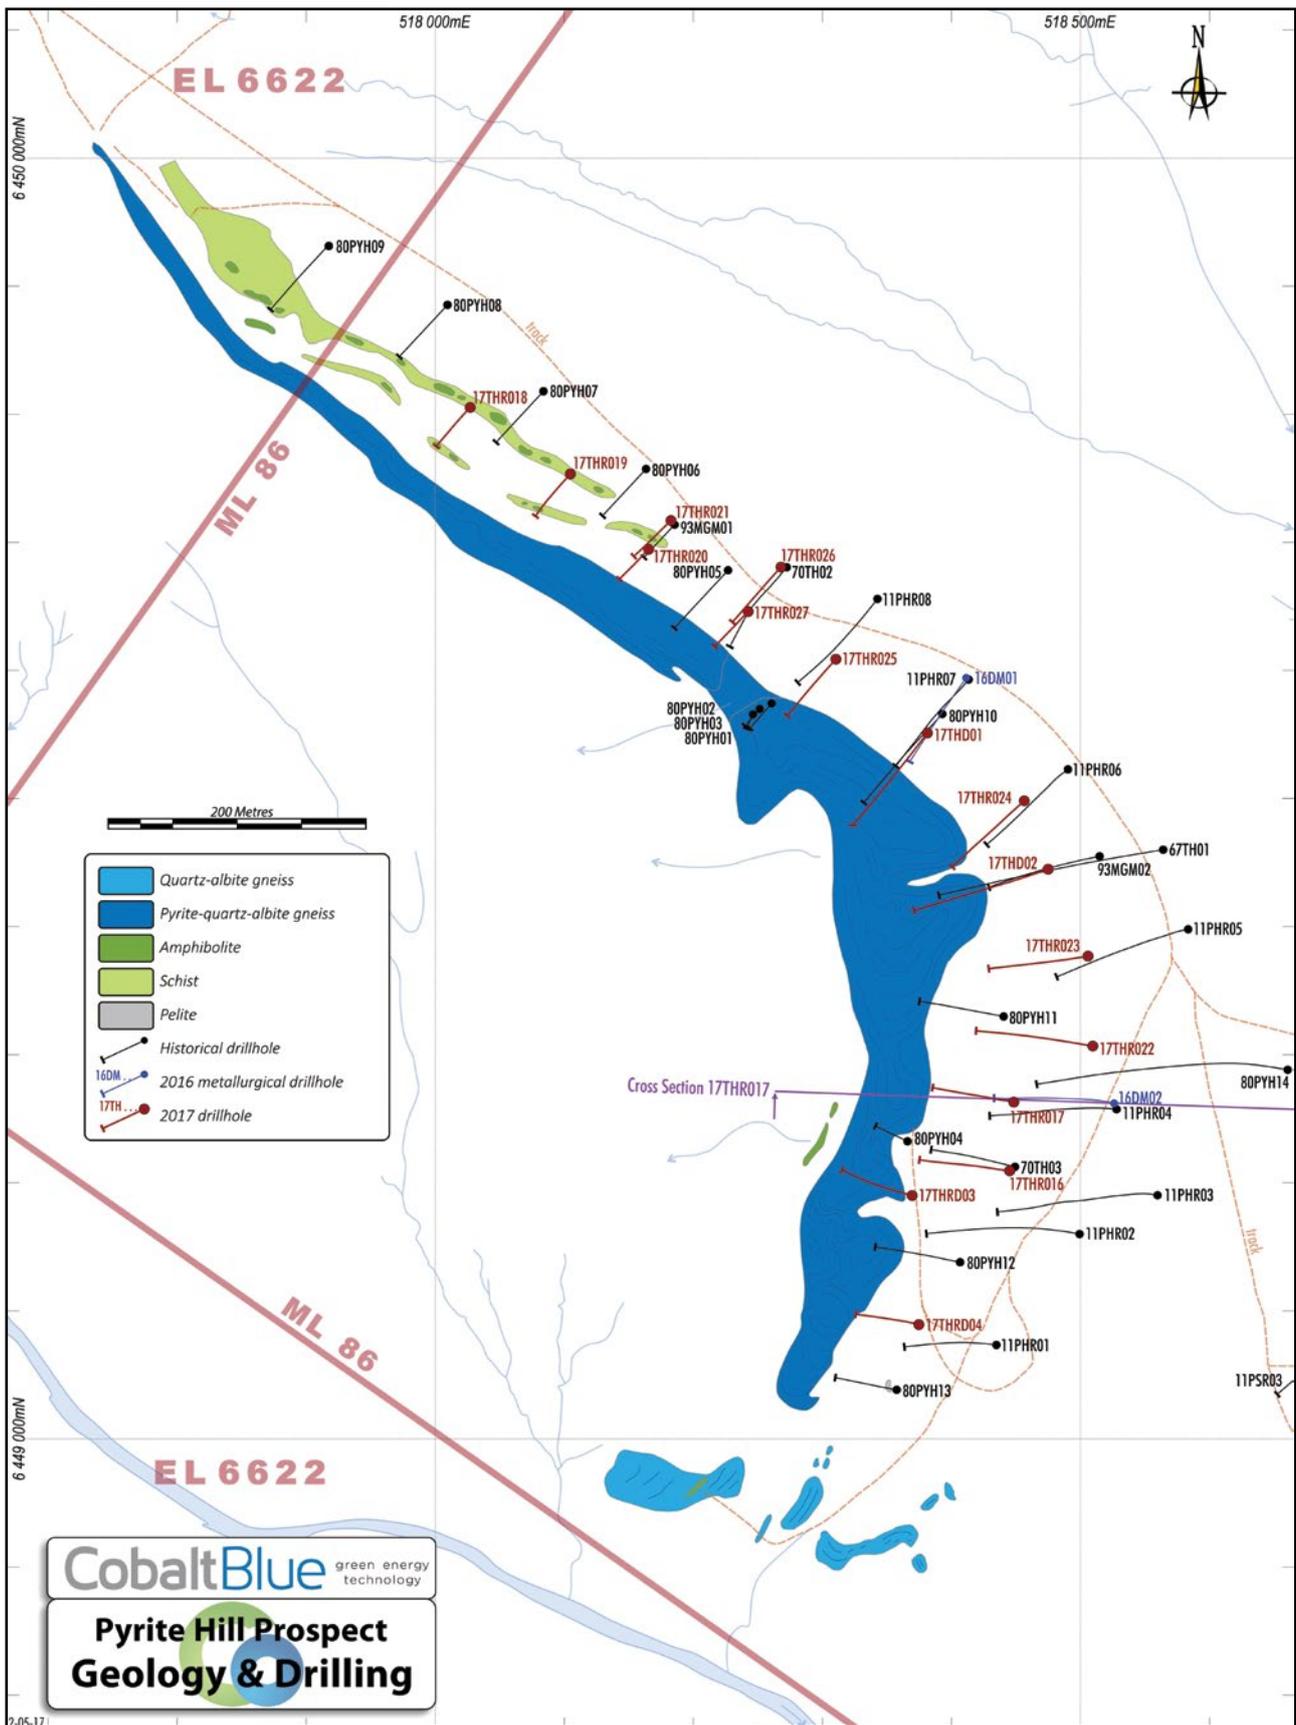

Figure 5: Plan view of Pyrite Hill

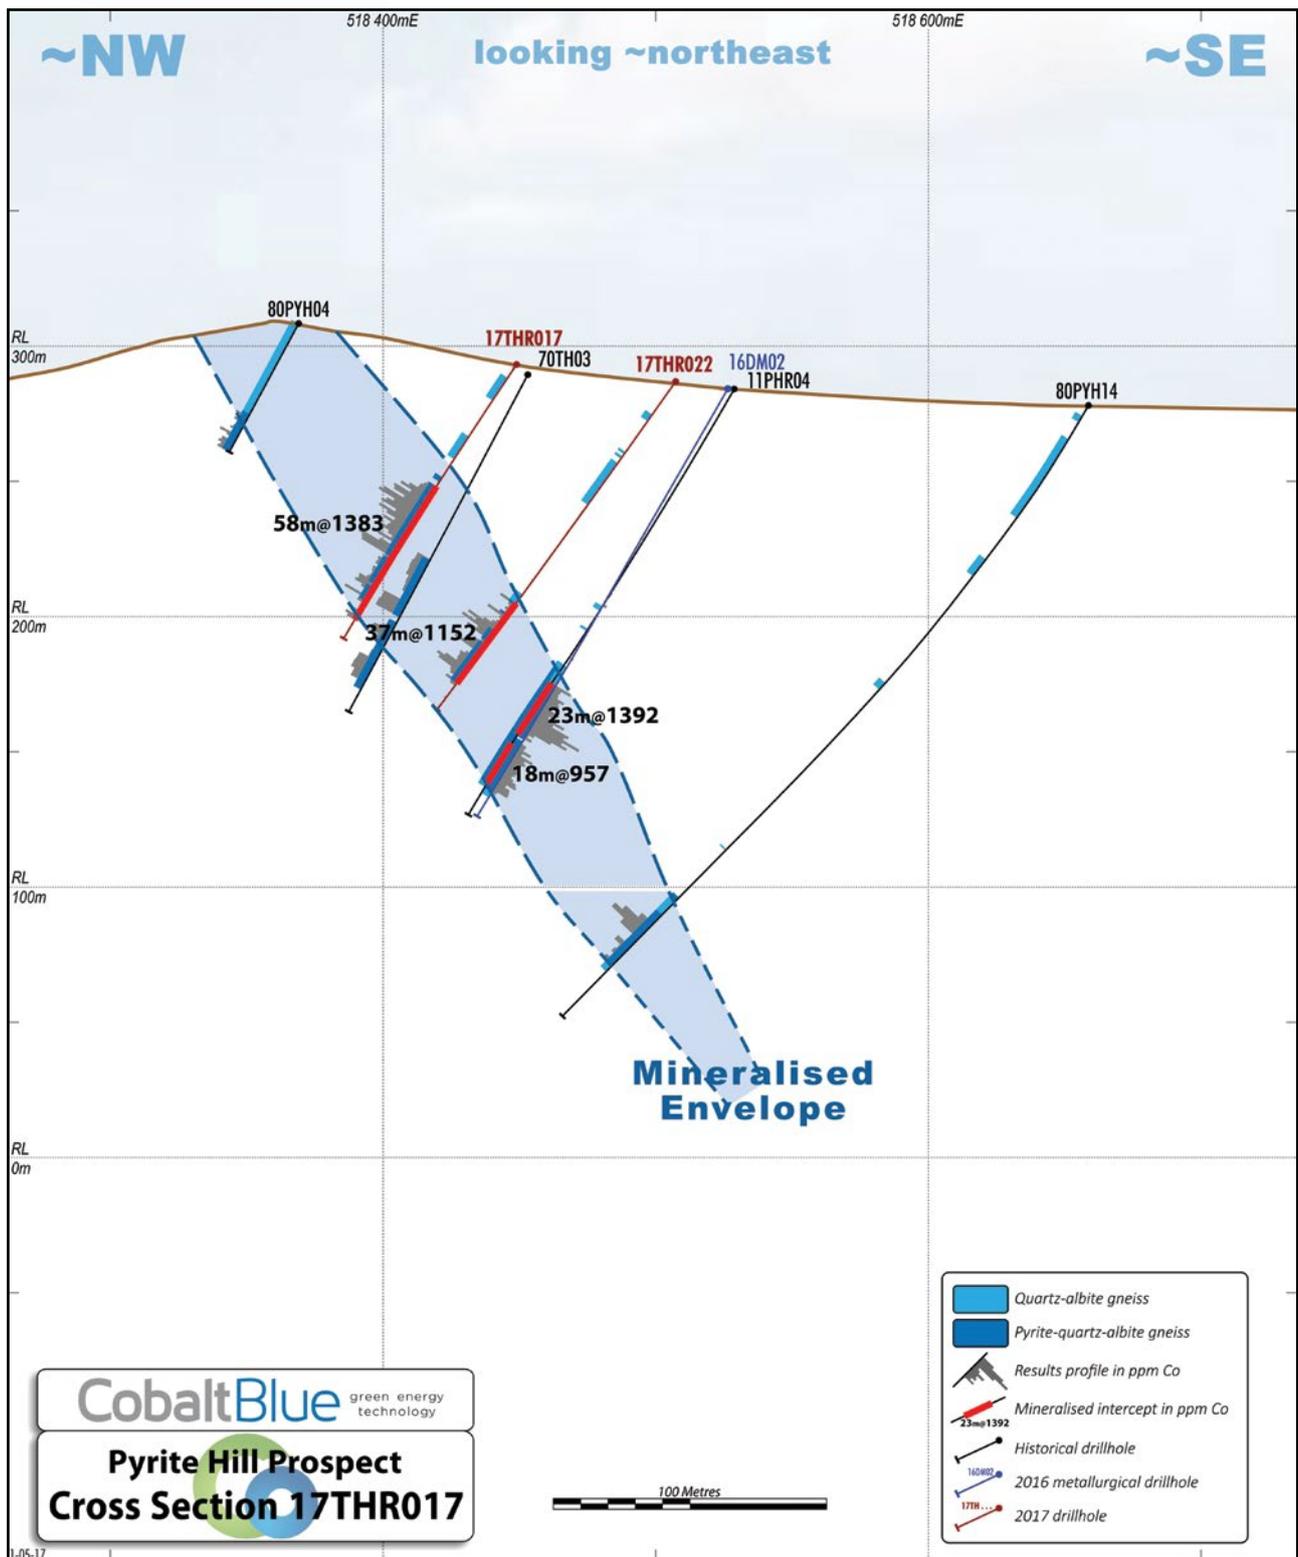

Figure 6: Pyrite Hill X-section along plane of 17THR017

Big Hill

The Big Hill deposit is an off-set southwestern extension of the high-grade metamorphic host at Railway. The drilling at Big Hill comprised two diamond holes for a total of 219m and three RC holes for a total of 314m. The RC program was designed to test the mineralisation at sparsely explored north-eastern end of the prospect at an interpreted offset fault zone between Big Hill and Railway. The diamond program comprised holes to provide solid core to assist the structural interpretation of this complex hinge structure.

Big Hill results

The 2017 drilling at Big Hill has discovered some structural complications at a fault zone, nevertheless some of the highest-yet cobalt mineralisation was intersected in this section. Best mineralised intercepts include:

- **Drillhole 17THR013** – 54m @ 888ppm Co, 5.4% S and 5.0% Fe from 19m drill depth

Cobalt Blue Background

Cobalt Blue (“COB”) is an exploration company focussed on green energy technology and strategic development to upgrade the existing mineral resource at the Thackaringa Cobalt Project in New South Wales. This strategic metal is in strong demand for new generation batteries, particularly lithium-ion batteries now being widely used in clean energy systems.

COB has entered into a farm-in joint venture agreement with Broken Hill Prospecting Limited (“BPL”) in which COB acquired an initial 51% interest in the Thackaringa Cobalt Project. COB will undertake exploration and development programs at the Thackaringa Cobalt Project and, subject to the achievement of milestones, will acquire 100% of the Thackaringa Cobalt Project.

The Thackaringa Project, 23 km west of Broken Hill and 400km by rail from Port Pirie consists of four granted tenements (EL6622, EL8143, ML86 and ML87) with total area of 63 km². The main target for exploration is well known and contains documented large tonnage cobalt bearing pyrite deposits. The project area is under-explored, with the vast majority of historical exploration directed at or around the outcropping pyritic cobalt deposits at Pyrite Hill and Big Hill.

Potential to extend the Mineral Resource at Pyrite Hill, Big Hill, Railway and the other prospects is high. Numerous other prospects within COB’s tenement package are early stage and under-explored.

Looking forward, we would like our shareholders to keep in touch with COB updates and related news items, which we will post on our website, the ASX announcements platform, as well as social media such as Facebook (f) and LinkedIn (in). Please don’t hesitate to join the ‘COB friends’ on social media and also to join our newsletter mailing list at our website.

Competent Person Statement

The information in this report that relates to exploration results, Mineral Resources and Targets is based on information compiled by Mr Anthony Johnston, BSc (Hons), who is a Member of the Australian Institute of Mining and Metallurgy and who is a non-executive director of Cobalt Blue Holdings Limited, the Chief Executive Officer of Broken Hill Prospecting Limited and the Technical Manager of the Joint Venture. Mr Johnston has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 & 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Johnston consents to the inclusion in the announcement of the matters based on his information in the form and context that the information appears.

Appendix – JORC Code, 2012 Edition – Table 1

Section 1 – Sampling Techniques and Data (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down-hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<p>Diamond Drilling (DD)</p> <p>Pre-1990</p> <ul style="list-style-type: none"> Diamond drilling was used to obtain core from which irregular intervals, reflecting visual mineralisation and geological logging were hand-split or sawn. Samples were submitted for analysis using a mixed acid digestion and AAS methodology <p>Post-1990</p> <ul style="list-style-type: none"> Diamond drilling (one drill hole) was used to obtain core from which irregular intervals, reflecting visual mineralisation and geological logging were sawn (quarter core for HQ). Samples were submitted for analysis using a mixed acid digestion and ICP-OES methodology <p>2016 Metallurgical Drilling</p> <ul style="list-style-type: none"> Eight HQ diameter diamond drill holes (DD) were drilled at the Thackaringa project in late 2016. They will be used as metallurgical reference holes and to twin some of the previous reverse circulation percussion (RC) holes for QA/QC and assay comparison between DD and RC. There were two holes drilled at Pyrite Hill, two at Big Hill and four at Railway: Diamond drilling was used to obtain core from which regular (one-metre) intervals were sawn with: <ul style="list-style-type: none"> one half core dispatched for analysis using a mixed acid digestion and ICP-AES methodology the other half was further sawn such that one quarter-core was sent for metallurgical test work and the other quarter-core retained for archival purposes <p>Historical Reverse Circulation Drilling</p> <ul style="list-style-type: none"> RC drilling was used to obtain a representative sample by means of riffle splitting with samples submitted for analysis using the above-mentioned methodologies Pre-2000 drill samples were assayed for a small and variable suite of elements (sometimes only cobalt). The post-2000 drill samples (5,095 samples) are all assayed by ICP-MS for a suite of 33 elements. <p>2017 Diamond Drilling Program</p> <ul style="list-style-type: none"> This announcement summarises the results from approximately 2/3 of the 2017 diamond drilling program. Fourteen HQ diameter diamond drill holes (DD) were assayed at the Thackaringa project. They will be used as metallurgical reference holes and to twin some of the previous reverse circulation percussion (RC) holes for QA/QC and assay comparison between DD and RC. There were four holes drilled at Pyrite Hill, two at Big Hill and 8 at Railway: Diamond drilling (17THD01-03) was used to obtain core from which regular (one-metre) intervals were sawn with: <ul style="list-style-type: none"> one half core dispatched for analysis using a mixed acid digestion and ICP-AES methodology the other half was retained for future metallurgical test work and archival purposes Diamond drilling (17THD04-14) was used to obtain core from which regular (one-metre) intervals were sawn with: <ul style="list-style-type: none"> one quarter core dispatched for analysis using a mixed acid digestion and ICP-AES methodology the other three quarters was retained for future metallurgical test work and archival purposes

Criteria	JORC Code Explanation	Commentary																																				
Sampling techniques <i>(continued)</i>		<p>2017 RC drilling Program</p> <ul style="list-style-type: none"> This announcement summarises the results from approximately 2/3 of the 2017 RC drilling program. Thirty eight (38) RC drill holes were drilled & assayed at the Thackaringa project. They will be used to infill the drill spacing of historic holes to allow a re-estimation of the existing Mineral Resource. There were 12 holes drilled at Pyrite Hill, three at Big Hill and 23 at Railway: RC drilling was used to obtain a representative sample by means of riffle splitting with samples submitted for analysis using the above-mentioned methodologies The 2017 drill samples are all assayed by ICP-MS for a suite of 33 elements. 																																				
Drilling techniques	<ul style="list-style-type: none"> <i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> The Thackaringa drilling database comprises a total of forty-eight (48) DD holes and eighty-one (81) RC drill holes. Diamond drilling was predominantly completed with standard diameter, conventional HQ and NQ utilising RC and percussion pre-collars to an average 25 metres (see Drill-hole Information for further details). Early (1960-1970) drill holes utilised HX – AX diameters dependent on drilling depth. Reverse circulation drilling utilised standard drill-hole diameters (4.8”-5.5”) with a face sampling hammer. During 2013, a single diamond drill hole (13BED01) was completed at the Railway deposit using a triple tube system with a HQ3 diameter <table border="1" data-bbox="740 1048 1423 1460"> <thead> <tr> <th>Year</th> <th>Drilling</th> <th>Metres</th> </tr> </thead> <tbody> <tr> <td>1967</td> <td>1 diamond drill hole</td> <td>304.2</td> </tr> <tr> <td>1970</td> <td>4 diamond drill holes</td> <td>496.6</td> </tr> <tr> <td>1980</td> <td>18 diamond and 1 RC drill hole</td> <td>1711.23</td> </tr> <tr> <td>1993</td> <td>2 diamond drill holes</td> <td>250</td> </tr> <tr> <td>1998</td> <td>11 RC drill holes</td> <td>1093.25</td> </tr> <tr> <td>2011</td> <td>11 RC drill holes</td> <td>1811</td> </tr> <tr> <td>2012</td> <td>20 RC drill holes</td> <td>2874.25</td> </tr> <tr> <td>2013</td> <td>1 diamond drill hole</td> <td>349.2</td> </tr> <tr> <td>2016</td> <td>8 diamond drill holes</td> <td>1484.8</td> </tr> <tr> <td>2017</td> <td>14 diamond drill holes and 38 RC drill holes</td> <td>6472</td> </tr> <tr> <td>Total</td> <td>48 diamond and 81 RC drill holes</td> <td>16,846.53</td> </tr> </tbody> </table> <ul style="list-style-type: none"> This ASX release describes assay results from seven (7) diamond drill holes and twenty-four (24) RC holes completed and assayed by April, 2017. Commencement of that drilling program was reported to ASX by the company in April 2017: <ul style="list-style-type: none"> Diamond drilling was completed using a triple tube system with a HQ3 diameter Holes were drilled at angles between 40 and 60 degrees from horizontal and the resulting core was oriented as part of the logging process. Sub-sampling techniques and sample preparation <i>(continued)</i>		<p>Historical Reverse Circulation Drilling</p> <ul style="list-style-type: none"> Sub-sampling of reverse circulation/percussion chips was achieved using a cyclone with cone or riffle splitter During drilling operations, the sample cyclone and splitter were regularly cleaned to prevent down hole sample contamination Dry sampling was achieved with the use of adequate air, using a compressor and booster, where groundwater was encountered During reverse circulation drilling completed by Broken Hill Prospecting, duplicate samples were collected at the time of drilling. These were obtained by spearing the bulk material held in the PVC sacks using a spear made of 40mm diameter PVC pipe; three samples were speared through the full depth of the bulk material and these were combined to form one sample The Thackaringa drilling database includes a total of 139 field duplicates collected during reverse circulation drilling. This reflects a ratio of approximately one field duplicate in every 32 samples (3.1%) for drill holes where duplicates were collected (31 drill holes for 4469 metres) and an overall ratio of one field duplicate in every 42 samples (2.4%) for all reverse circulation drill holes (43 drill holes for 5801.5 metres). Statistical analysis of field duplicates collected during drilling completed by Broken Hill Prospecting (119 duplicates representing 86% of all field duplicates) considered 18 elements of which only chromium, lanthanum and titanium show some bias in the duplicate samples. For cobalt, the confidence limits were evenly placed either side of zero and the duplicates are deemed to be representative of the original samples. <p>2017 Reverse Circulation Drilling</p> <ul style="list-style-type: none"> Sub-sampling of reverse circulation/percussion chips was achieved using a riffle splitter. During drilling operations, the splitter was regularly cleaned to prevent down hole sample contamination. Dry sampling was achieved with the use of adequate air, using a compressor and booster, where groundwater was encountered. During reverse circulation drilling completed by Broken Hill Prospecting, duplicate samples were collected at the time of drilling. These were obtained by riffle splitting the remnant bulk sample following collection of the primary split. Field duplicate samples were collected regularly during drilling (for every 18th sample on average). Assay results received to date include analysis of 120 field duplicate pairs from 24 RC drill holes. A measure of the average precision of the sampling, sample preparation and assaying methods, given by the mean per cent difference (MPD) assay values of the duplicate pairs is summarised below. Overall, the sampling and assay precision for Co, Fe and S at economically significant grades is regarded as reasonable. <table border="1" data-bbox="734 1680 1404 1904"> <thead> <tr> <th colspan="5">RC Field Duplicate Pairs</th> </tr> <tr> <th>Co Cut-Off</th> <th>Count</th> <th>Co MPD</th> <th>S MPD</th> <th>Fe MPD</th> </tr> </thead> <tbody> <tr> <td>All</td> <td>120</td> <td>13%</td> <td>16%</td> <td>9%</td> </tr> <tr> <td>200ppm</td> <td>52</td> <td>13%</td> <td>11%</td> <td>10%</td> </tr> <tr> <td>500ppm</td> <td>34</td> <td>12%</td> <td>9%</td> <td>9%</td> </tr> <tr> <td>1000ppm</td> <td>20</td> <td>8%</td> <td>7%</td> <td>7%</td> </tr> </tbody> </table>	RC Field Duplicate Pairs					Co Cut-Off	Count	Co MPD	S MPD	Fe MPD	All	120	13%	16%	9%	200ppm	52	13%	11%	10%	500ppm	34	12%	9%	9%	1000ppm	20	8%	7%	7%

Criteria	JORC Code Explanation	Commentary
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	<ul style="list-style-type: none"> The nature and quality of all assaying and laboratory procedures employed for samples obtained through drilling (diamond and reverse circulation) are considered 'industry standard' for the respective periods The assay techniques employed for drilling (diamond and reverse circulation) include mixed acid digestion with ICP-OES and AAS finishes. These methods are considered appropriate for the targeted mineralisation and regarded as a 'near total' digestion technique with resistive phases not expected to affect cobalt analyses All samples have been processed at independent commercial laboratories including AMDEL, Australian Laboratory Services (ALS), Analabs and Genalysis All samples from drilling completed by Broken Hill Prospecting during 2011-2012 were assayed at ALS in Orange, New South Wales. All samples from drilling completed by Broken Hill Prospecting during 2016-2017 were assayed at ALS Adelaide, South Australia. ALS is a NATA Accredited Laboratory and qualifies for JAS/ANZ ISO9001:2008 quality systems. ALS maintains robust internal QA/QC procedures (including analysis of standards, repeats and blanks). To monitor the accuracy of assay results from the 2017 Thackaringa drilling, CRM standards were included in the assay sample stream every 24 samples (on average) for RC chips and every 30 samples for diamond core. The CRM samples were purchased from Ore Research & Exploration Pty Ltd and the results are summarised below:

OREAS Standard	Count	Cobalt				Sulphur				Iron			
		±1SD	±2SD	±3SD	±3SD+	±1SD	±2SD	±3SD	±3SD+	±1SD	±2SD	±3SD	±3SD+
160 Low S Blank (2.8ppm Co)	12	10	–	–	2	7	–	–	5	6	2	2	2
162 Medium Grade (631ppm Co)	53	37	12	3	–	32	18	3	–	14	12	13	14
163 Low Grade (230ppm Co)	40	30	8	2	–	7	25	7	1	2	3	2	33
165 High Grade (2445ppm Co)	13	11	2	–	–	7	5	1	–	1	5	2	5
166 High Grade (1970ppm Co)	35	26	8	–	1	27	6	–	2	9	5	5	16
	153	114	30	5	3	80	54	11	8	32	27	24	70
		75%	20%	3%	2%	52%	35%	7%	5%	21%	18%	16%	46%

Cobalt CRM Standards

Internal COB assay QA/QC protocols, cobalt performed well with 95% standard analyses falling within two standard deviations of the certified value; and 75% within one SD. No systematic out-of-specification trends were identified, and there was no discernible tendency for a particular Co standard to preferentially assay either higher or lower than the certified Co concentration.

Cobalt Blanks

A number of blanks were also submitted with the RC chip and diamond core samples — the OREAS160 CRM is essentially a low-sulphide blank with respect to cobalt (2.8ppm) and the results of assay of this standard are summarised in Table 1. In addition, five quartz sand blanks were submitted, bracketing very pyrite-rich intervals in diamond drill holes 17THD06 and 17THD07. Overall, the quartz sand blanks returned a maximum of 6.9ppm Co; 0.04% S; and 0.65% Fe which are regarded as similar to background values and any contamination during sample preparation at the assay laboratory is likely to be immaterial to the final results

Based on the assay of standards and blanks with 95% of the Co results falling within two standard deviations of the certified value, it is concluded that the assay results for Co are likely to be representative for the material submitted with no additional source of inaccuracy or bias identified.

Sulphur CRM Standards

sulphur was reasonably well-performed with 87% of the total 153 standard analyses falling within two standard deviations of the certified value and 95% within 3SD.

Iron CRM Standards

Iron analysis of standards showed poor accuracy with a tendency to assay low — 46% of the assays fall outside of 3 SD, typically, but not exclusively, lower than the certified value.

Criteria	JORC Code Explanation	Commentary
Verification of sampling and assaying	<ul style="list-style-type: none"> ■ <i>The verification of significant intersections by either independent or alternative company personnel.</i> ■ <i>The use of twinned holes.</i> ■ <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> ■ <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> ■ Historical drilling intersections were internally verified by personnel employed by previous explorers including CRAE Pty Limited, Central Austin Pty Limited and Hunter Resources. Broken Hill Prospecting has completed a systematic review of the related data. ■ The Thackaringa drilling database exists in electronic form as a Microsoft Access database. Information related to individual drill holes is stored in digital files as extracted from historical reports (typically including location plan, section, logs, photos, surveys, assays and petrology). ■ Historical drilling data available in electronic form has been re-formatted and imported into the drilling database. ■ Quantitative historical drilling data, including assays, have been captured electronically during systematic data compilation and validation completed by Broken Hill Prospecting. ■ Samples returning assays below detection limits are assigned half detection limit values in the database. ■ All significant intersections are verified by the Company's Exploration Manager and independent geological consultant
Location of data points	<ul style="list-style-type: none"> ■ <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> ■ <i>Specification of the grid system used.</i> ■ <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> ■ Historical drill collars have been relocated and surveyed using a differential GPS (DGPS). In the instances where no collar could be located the position has been derived from georeferenced historical plans. ■ During systematic data validation completed in 2016, three drill holes at Big Hill were found to be incorrectly located. One collar was located and surveyed by GPS and two were digitised from georeferenced historical plans (reported to the nearest metre) as the collars had been destroyed. These corrections were captured in the Big Hill Mineral Resource estimate. ■ Down hole surveys using digital cameras were completed on all post 2000 drilling. Down hole surveys for some earlier drilling were estimated from hole trace and section data where raw survey data was not reported. ■ All 2017 Thackaringa drill hole collars were located and surveyed with DGPS by an independent surveyor with reported accuracy of $\pm 0.05\text{m}$ in horizontal and vertical measurement. ■ Downhole surveys using digital cameras were completed on all 2017 drill-holes. ■ All data is recorded in the GDA94 datum; UTM Zone 54 (MGA54). ■ 3D validation of drilling data has been completed by independent geological consultants to support detailed geological modelling in Micromine™ software. ■ The quality of topographic control is deemed adequate in consideration of the results presented in this release.
Data spacing and distribution	<ul style="list-style-type: none"> ■ <i>Data spacing for reporting of Exploration Results.</i> ■ <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> ■ <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> ■ The data density of existing drill holes at Thackaringa has been materially increased by the 2017 drilling program which was undertaken primarily to undertake infill drilling. ■ Detailed geological mapping supported by drill-hole data of sufficient spacing and distribution to establish a 3D geological model. ■ The level of geological and grade continuity is appropriate for the Mineral Resource estimation methodologies used and the classifications applied (being wholly Inferred Mineral Resources). Note that a recalculation of the Mineral Resource using 2017 drilling and assay data will commence in mid-2017. ■ No sample compositing has been applied to reported intersections.

Criteria	JORC Code Explanation	Commentary
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> ■ <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> ■ <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> ■ The 2017 drill holes at the Thackaringa project were typically angled at -50° or -60° to the horizontal and drilled perpendicular to the mineralised trend with drilling orientations adjusted along strike to accommodate folded geological sequences. ■ Mineralisation at the Big Hill and Railway prospects is steeply dipping and consequently mineralised intersections will be greater than true width. At Pyrite Hill mineralisation is gently dipping and mineralised intersections will be close to true width. ■ The drilling orientation is not considered to have introduced a sampling bias on assessment of the current geological interpretation.
Sample security	<ul style="list-style-type: none"> ■ <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> ■ Sample security procedures are considered to be 'industry standard' for the respective periods. ■ Following recent drilling completed by BPL, samples were trucked by an independent courier directly from Broken Hill to ALS, Adelaide. ■ BPL consider that risks associated with sample security are limited given the nature of the targeted mineralisation.
Audits or reviews	<ul style="list-style-type: none"> ■ <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> ■ In late 2016 an independent validation of the Thackaringa drilling database was completed: <ul style="list-style-type: none"> ■ The data validation process consisted of systematic review of drilling data (collars, assays and surveys) for identification of transcription errors ■ Following review, historical drill hole locations were also validated against georeferenced historical maps to confirm their location ■ Three (3) drill holes at Big Hill were found to be incorrectly located. One collar was located and surveyed by GPS and two were digitised from georeferenced historical plans (reported to the nearest metre) as the collars had been destroyed. These corrections were captured in the Big Hill Mineral Resource estimate ■ Total depths for all holes were checked against original reports ■ Final 3D validation of drilling data has been completed by independent geological consultants to support detailed geological modelling in Micromine™ software ■ Audits and reviews of QAQC results and procedures are further described in preceding sections of this table including Quality of assay data and laboratory tests, Sub-sampling techniques and sample preparation and Logging.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The project tenure is subject to a Farm-In agreement between Cobalt Blue Holdings Limited (COB) and Broken Hill Prospecting Limited (BPL). The nature of this agreement is detailed in the COB Replacement Prospectus (as released 4 January 2017). The nearest residence (Thackaringa Station) is located approximately three kilometres west of EL6622. EL6622 is intersected by the Transcontinental Railway; the Barrier Highway is located the north of the licence boundaries. The majority of the project tenure is covered by Western Lands Lease which is considered to extinguish native title interest. However, Native Title Determination NC97/32 (Barkandji Traditional Owners 8) is current over the area and may be relevant to Crown Land parcels (e.g. public roads) within the project area. The project tenure is more than 90 kilometres from the nearest National Park and or Wilderness Area (Kinchega National Park) and approximately 20 kilometres south of the nearest Water Supply Reserve (Umberumberka Reservoir Water Supply Reserve) The Company is not aware of any impediments to obtaining a licence to operate in the area. 																														
		<ul style="list-style-type: none"> A detailed and complete record of all exploration activities undertaken prior to the BPL 2016 drilling program is appended to the JORC Table 1 which forms part of the Cobalt Blue Prospectus Document, available on the COB website. 																														

Criteria	JORC Code Explanation	Commentary
Geology	<ul style="list-style-type: none"> ■ <i>Deposit type, geological setting and style of mineralisation.</i> 	<p>Regional Geological Setting</p> <ul style="list-style-type: none"> ■ The Thackaringa project is located in a deformed and metamorphosed Proterozoic supracrustal succession named the Willyama Supergroup, which crops out as several inliers in western New South Wales, including the Broken Hill Block (Willis, et al., 1982). ■ Exploration by BPL Limited has been focused on the discovery of cobaltiferous pyrite deposits and Broken Hill type base-metal mineralisation both of which are known from historical exploration in the district. ■ The project area covers portions of the Broken Hill and Thackaringa group successions which host the majority of mineralisation in the region, including the Broken Hill base-metal deposit. The Sundown Group suite is also present. The extensive sequence of quartz-albite-plagioclase rock that hosts the cobaltiferous pyrite mineralisation is interpreted as belonging to the Himalaya Formation, which is stratigraphically at the top of the Thackaringa Group. <p>Local Geological Setting</p> <ul style="list-style-type: none"> ■ The oldest rocks in the region belong to the Curnamona Craton which outcrops on the Broken Hill and Euriovie blocks. ■ The overlying Proterozoic rocks have been broadly subdivided into three major groupings, of which the oldest groups are the highly deformed metasediments and igneous derived rocks of the Thackaringa and Broken Hill groups. They comprise a major part of the Willyama Supergroup and host the giant Broken Hill massive Pb-Zn-Ag sulphide ore body. EL6622 is within the Broken Hill block of the Curnamona Craton. <p>Mineralisation Style</p> <ul style="list-style-type: none"> ■ The Thackaringa Mineral deposits (Pyrite Hill, Big Hill and Railway) are characterised by large tonnage cobaltiferous-pyrite mineralisation hosted within siliceous albitic gneisses and schists of the Himalaya Formation. ■ Cobalt mineralisation exists within stratabound pyritic horizons where cobalt is present within the pyrite lattice. Mineralogical studies have indicated the majority of cobalt (~85%) is found in solid solution with primary pyrite (Henley 1998). ■ A strong correlation between pyrite content and cobalt grade is observed. ■ The regional geological setting indicates additional mineralisation targets including: <ul style="list-style-type: none"> ■ Stratiform Broken Hill Type (BHT) Copper-Lead-Zinc-Silver deposits ■ Copper-rich BHT deposits ■ Stratiform to stratabound Copper-Cobalt-Gold deposits ■ Epigenetic Gold and Base metal deposits
Drill hole Information	<ul style="list-style-type: none"> ■ <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> ■ <i>easting and northing of the drill hole collar</i> ■ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> ■ <i>dip and azimuth of the hole</i> ■ <i>down hole length and interception depth</i> 	<ul style="list-style-type: none"> ■ See drill hole summaries below:

Criteria	JORC Code Explanation	Commentary
Data aggregation methods	<ul style="list-style-type: none"> ■ <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i> ■ <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> ■ <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<p>Drilling</p> <ul style="list-style-type: none"> ■ Drill hole intercept grades are typically reported as down-hole length-weighted averages with any non-recovered sample within the reported intervals treated as no grade. The cut-off used for selecting significant intersections is selected to reflect the overall tenor of mineralisation, in most cases 500ppm cobalt. ■ No top cuts have been applied when calculating average grades for reported significant intersections. ■ No metal equivalent values are reported .
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> ■ <i>These relationships are particularly important in the reporting of Exploration Results.</i> ■ <i>If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.</i> ■ <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> ■ Drill holes at the Thackaringa project are typically angled at 50° or 60° and drilled perpendicular to the mineralised trend with drilling orientations adjusted along strike to accommodate folded geological sequences. ■ Mineralisation at the Big Hill and Railway prospects is steeply dipping and consequently mineralised intersections will be greater than true width. At Pyrite Hill mineralisation is gently dipping and mineralised intersections will be close to true width. ■ There is insufficient geological knowledge to accurately estimate true widths and as such all drill intersections are reported as down hole lengths.
Diagrams	<ul style="list-style-type: none"> ■ <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views</i> 	<ul style="list-style-type: none"> ■ Appropriate maps and sections are presented in the accompanying ASX release.
Balanced reporting	<ul style="list-style-type: none"> ■ <i>Where comprehensive reporting of all exploration results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> ■ Only mineralised drill hole intersections regarded as highly anomalous and of economic interest are reported. The proportion of each hole represented by the reported intervals can be ascertained from the sum of the reported intervals divided by the total drill hole depth. ■ All assay results for drill holes included in the various Mineral Resource estimates have been considered and comprise results not necessarily regarded as anomalous

Criteria	JORC Code Explanation	Commentary
Other substantive exploration data	<ul style="list-style-type: none"> ■ <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, ground-water, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> ■ No further exploration data is deemed material to the results presented in this release.
Further work	<ul style="list-style-type: none"> ■ <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> ■ <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> ■ The nature and scale of planned further work will be determined following the completion of revised Mineral Resource estimation for the Thackaringa deposits scheduled for May 2017.
