2010 Snowbird Exploration Program Identifies Eight New Late-Time EM Anomalies and Returns Significant Base Metal and Gold Results in Rock Chip Assay's

The 2010 exploration program at the Snowbird project is complete. The company completed the following exploration activities:

- A prospecting and geologic mapping campaign improved the geologic understanding of the project area and collected 225 rock samples (outcrop and glacial boulders) for analysis for gold, silver, PGE, and base metals (Figure 1).
 - Lithogeochemical analyses reported significant Cu, PGE, Au, Zn and Ag in bedrock and boulder samples.
 - Preliminary analysis of the samples does not support a target for significant Ni mineralisation, but rather may suggest the presence of a multi element VMS style target with strongly anomalous Zn, Cu, Pb Au and PGE's.
 - Outcrop and glacially transported boulders of gabbroic rock with disseminated to net textured chalcopyrite returned copper values ranging from 0.20% to 2.45% Cu with anomalous PGE values from negligible up to 0.39 g/t Pd and 0.25 g/t Pt.
 - VMS style mineralization was also analysed with metal values ranging from negligible up to 3.78% Zn, 0.77% Cu, 0.97% Pb, 62 g/t Ag and 17.80 g/t Au.
 - Analysis of the samples is ongoing.
- Approximately 1599 line-km were flown by Aeroquest Ltd. using AeroTEM IV helicopter-borne system in late August / early September 2010.
 - The survey covered two blocks, one contiguous to the north and one to the south of an area flown in 2005 (Figure 2).
 - Interpretation identified eight late-time EM anomalies that require field investigation and follow-up during the 2011 field program to determine significance.

The information in this release has been reviewed by Mr. Joseph Campbell, P.Geo., of GeoVector Management Inc. Mr. Campbell is a member of the Association of Professional Geologists of Ontario, which is a Recognized Overseas Professional Organization (ROPO) and he has sufficient experience which is relevant to the styles of mineralisation and types of deposits under consideration, and to the planned activity, to qualify as a Competent Person as defined in the 2004 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (The JORC Code). Mr. Campbell has verified the information disclosed in this release and consents to the inclusion of such information in the form and context in which it appears.

A handwritten signature in black ink, appearing to read 'Alex Hewlett'.
