## **SEVEN VTEM ANOMALIES IDENTIFIED AT CLARA HILLS**

- **Recent VTEM geophysical survey at the Clara Hills Project in Western Australia, has highlighted seven anomalies within close proximity to the recent RC drilling which intersected nickel sulphides.**

Proto Resources and Investments Limited ("Proto" the "Company") is pleased to announce that the recently completed Versatile Time-Domain Electromagnetic ("VTEM") geophysical survey at the Clara Hills Project has identified seven anomalies four of which have been highlighted as strong and three as moderately strong.

Proto Resources is very pleased at the further success of Victory Mines Limited's ("Victory") exploration efforts at the Clara Hills joint venture project with Proto. Victory's earlier drilling success, discovering nickel and copper sulphides, make the VTEM anomalies potentially more significant and should inform new drill targets.

The Company refers shareholders to the announcement released by our joint venture partner, Victory Mines Limited (ASX:VIC).

Managing Director, Mr Andrew Mortimer said "Proto's joint venture with Victory Mines is providing Proto with even more mineral exploration upside while the Company focuses on the Lindemans Bore and Barnes Hill Projects. Clara Hills holds the potential of becoming a very significant nickel and copper sulphide discovery for Victory and Proto once further work is done"
