

## GOLDEN CAMEL PROGRESS REPORT

Iron Mountain Mining Ltd, "Iron Mountain" (ASX: IRM) is pleased to announce the following update on the progress of its Golden Camel Project in Victoria. The Golden Camel Project currently hosts an Indicated & Inferred JORC Resource of 256,000t @ 2.5g/t Au (ASX 17 July 2012) which the company is working towards developing as a small open pit mining operation under a proposed toll treatment or ore purchase scenario. All outstanding results from the recent geotechnical, metallurgical and resource infill drilling program have finally been received and collated which has also allowed the critical metallurgical test work to commence. The company hopes that ongoing work including re-estimation of the resource, final pit optimisation, mine scheduling and final cash flow modelling is expected to culminate in a decision on whether or not to proceed to mining by late 2013 - early 2014.

### DIAMOND DRILLING RESULTS

Drilling at the Golden Camel Gold Project (MIN5548) commenced on 18 March and was completed on 9 May. The planned program comprised of 8 diamond core (HQ) holes for a total of 540m with an anticipated completion date of approximately mid-April. The final completed drilling program comprised of 7 diamond core holes (HQ) for a total of 538.8m. All holes were drilled oriented triple tube HQ diamond core to maximise core return for use in planned geotechnical, metallurgical and resource evaluation of the deposit. Final surveyed individual hole and collar details are provided below in Table 1.

Collar*	Easting (GDA94)	Northing (GDA94)	RL	Azimuth**	Dip	Depth(m)	Target
GTC02	297723.96	5941955.90	239.56	262°	-60°	61.4	<i>Geotechnical</i>
EXP04	297630.60	5941977.83	228.58	077°	-55°	96.5	<i>Geotechnical/Resource Model</i>
MET02	297652.01	5941881.43	245.92	0°	-90°	74.4	<i>Metallurgical</i>

EXP01	297626.24	5941831.13	240.21	082°	-50°	72.4	<i>Resource Model</i>
EXP05	297662.62	5942018.78	227.38	085°	-50°	83.7	<i>Resource Model</i>
EXP06	297669.37	5941977.08	233.49	080°	-50°	70.7	<i>Resource Model</i>

\* Hole numbers non-consecutive due to hole redesign & repositioning of collar locations

\*\* Azimuth adjusted 11° for magnetic north

Table 1 - Final individual hole and collar details for Golden Camel technical drilling program

Historical studies have confirmed that gold mineralisation at Golden Camel occurs in oxidised haematitic cherts interpreted as being interbedded sediments or exhalatives within a Cambrian andesitic to basaltic volcanosedimentary package within the Heathcote Greenstone Belt of the Colbinabbin Range in central Victoria.

Updated interpretation of the deposit completed as part of the maiden resource estimation and refined as part of the post-drilling evaluation interprets the geometry of the mineralisation as striking NNE-SSE and dipping steeply to the west. Three of the seven holes drilled did not have azimuths and inclinations designed to intersect mineralisation at close to true width as possible:

Level 7 | 231 Adelaide Terrace | Perth | Western Australia | 6000

PO Box 3235 | 256 Adelaide Terrace | Perth | Western Australia | 6832

t +61 (8) 9225 6475 f +61 (8) 9225 6474 e [info@ironmountainmining.com.au](mailto:info@ironmountainmining.com.au) www [ironmountainmining.com.au](http://ironmountainmining.com.au)

- GTC02 (Azim 262 / Dip -60) - designed to provide footwall geotechnical data to assist pit design
- MET02 (Azim 0 / Dip -90) - vertical hole designed to intersect mineralisation down dip
- MET03 (Azim 169 / Dip -70) - inclined hole designed to intersect mineralisation down plunge

Metallurgical holes MET02 & MET03 were designed to maximise the recovery of mineralised material for subsequent bulk sample metallurgical test work by drilling as close to down dip and down plunge as possible. Collar locations and strings depicted in Figure 1.

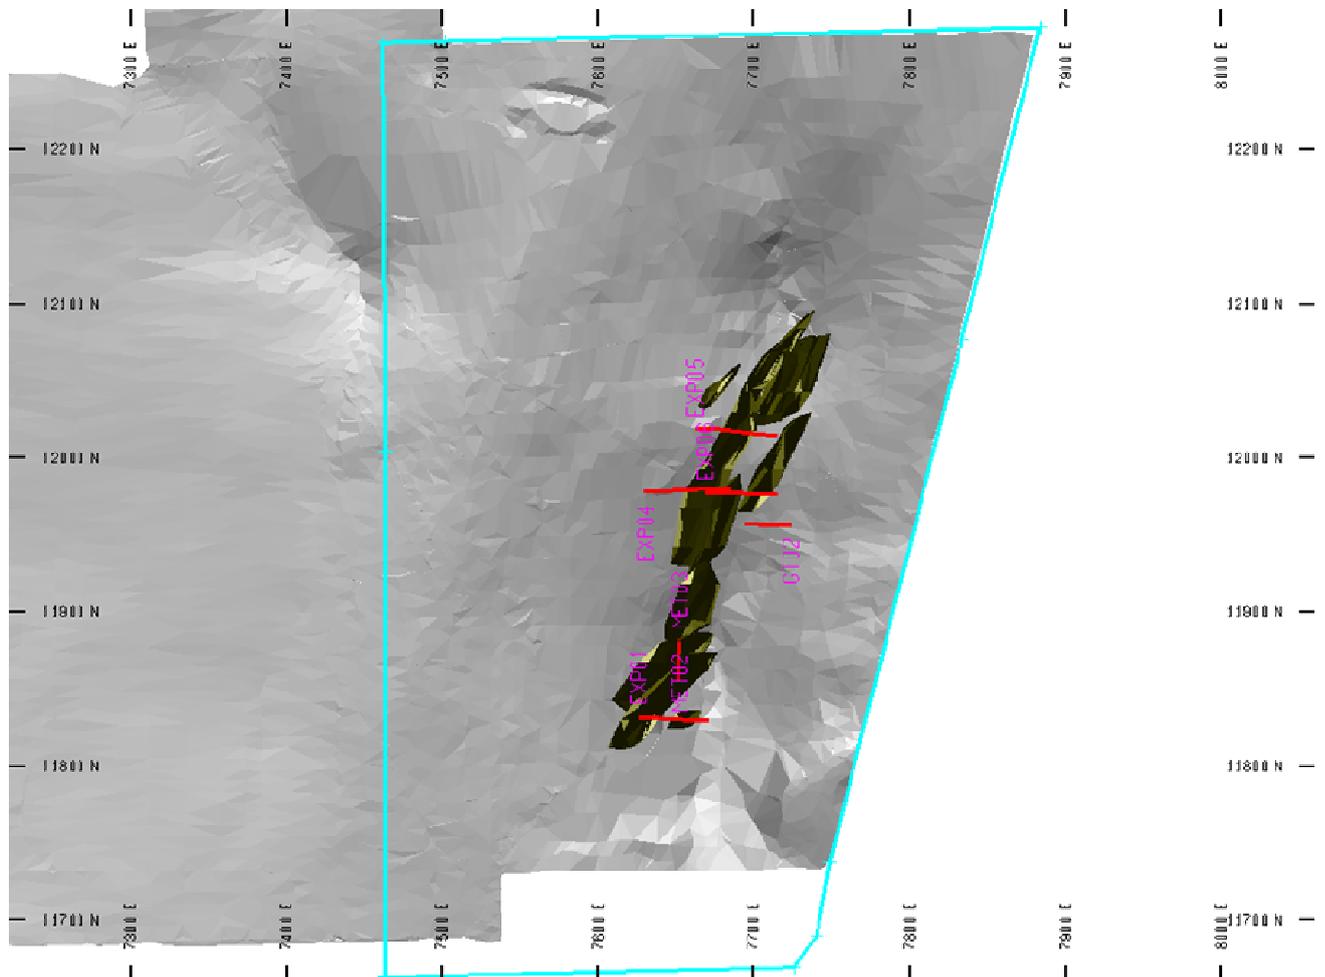

Figure 1 - Plan view showing MIN5548 boundary and recently drilled diamond core collars & strings with updated mineralisation interpretation over current topography

Results have now been received and collated for all holes for reporting and evaluation. Samples for all holes except MET02 & MET03 were sent to Onsite Laboratory Services in Bendigo for Fire Assay (AU) and 9 element ICP analysis. MET02 & MET03 were sent to ALS Burnie for Fire Assay (Au), 33 element ICP analysis and subsequent metallurgical test work.

Significant gold intersections (1g/t Au cut-off) have been calculated and reported in Table 2 where present. Economic grade mineralisation was not expected in the geotechnical drilling (GTC02 & EXP04) however assaying was selectively undertaken according to geology/structures to aid categorization of the barren rock that will need to be excavated during mining and to assist with visual identification of rock types for any future grade control.

Hole	Best Au Intersections
GTC02	NSI
EXP04	NSI
MET02	1.5m @ 1.66g/t Au (46-47.5m)
MET03	<b>17.5m @ 4.18g/t Au (26-43.5m)</b> Incl. 2.5m void (37-39.5m) <b>Incl. 4.5m @ 8.57g/t Au (26-30.5m)</b> 4m @ 1.91g/t Au (65.5-69.5m)
EXP01	1m @ 3.20g/t Au (0-1m) <b>8m @ 1.78g/t Au (6-14m)</b> <b>Incl. 4m @ 2.83g/t Au (10-14m)</b> 4m 1.98g/t Au (22-24m) Incl. 0.5m core loss (22.5-23m)
EXP05	NSI
EXP06	2m @ 1.13g/t Au (47-49m) 1.5m @ 1.93g/t Au (52-53.5m)

Holes reported in drilled order  
Au (1g/t cut-off)  
NSI = No Significant Intersection

Table 2 - Significant Au intersections (1g/t Au cut-off) from HQ diamond drilling program at Golden Camel.

The best intersection (**17.5m @ 4.18g/t Au**) as expected was returned from one of the metallurgical holes (MET03) which was deliberately designed to maximise the recovery of mineralised core by drilling down plunge (see Fig.2). MET02 surprisingly failed to intersect mineralisation as planned however a subsequent review of the position of the MET03 intersection and the applied mine grid to MGA94 translation suggests that a slight adjustment to the mineralisation interpretation was required (see Fig.3). The results from all other holes were in line with geotechnical and resource infill expectations.

These results will now be used to undertake a re-estimation of the Golden Camel resource which will also incorporate detailed geological, structural and density data that was compiled during the diamond drilling and core logging program. All samples for all holes were also assayed for at least a baseline 9 element ICP suite comprised of Ag, As, Ni, Cu, Fe, K, Mo, S & Sb in order to provide sufficient information to:

1. Map the levels of potentially deleterious elements that could negatively affect the leach/recovery process and allow a mine design that predicts and reports the presence of such elements during mining
2. Compile sufficient data to undertake Net Acid Production Potential (NAPP), Sulfide Sulfur and Net Acid Generation (NAG) tests on waste rock to determine waste dump design criteria

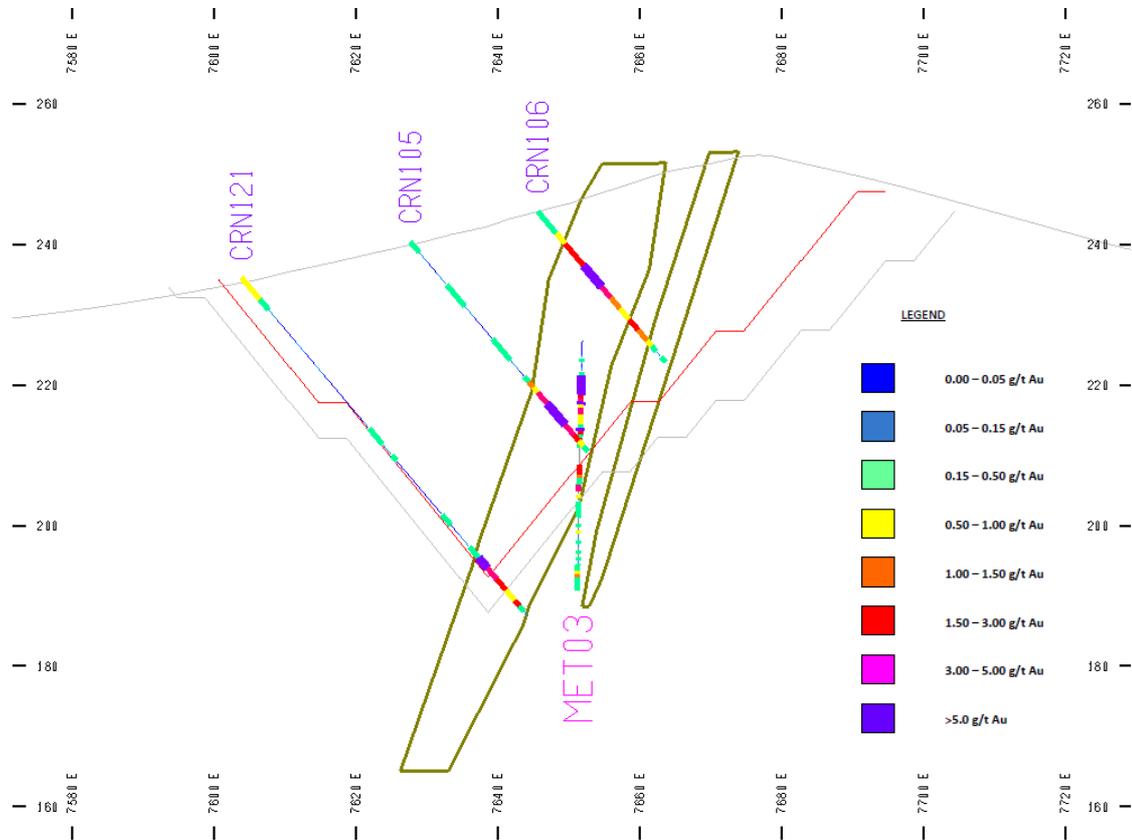

Figure 2 - Section 11867.5N showing optimised pits (A\$1300/oz red & A\$1900/oz grey) with significant Au intersections (1g/t Au cut-off) from historical RC (CRN 1994) and HQ diamond core (MET03 2013) drilling (NOTE: MET03 drilled at azimuth 169 which is depicted as "out of page" in this section)

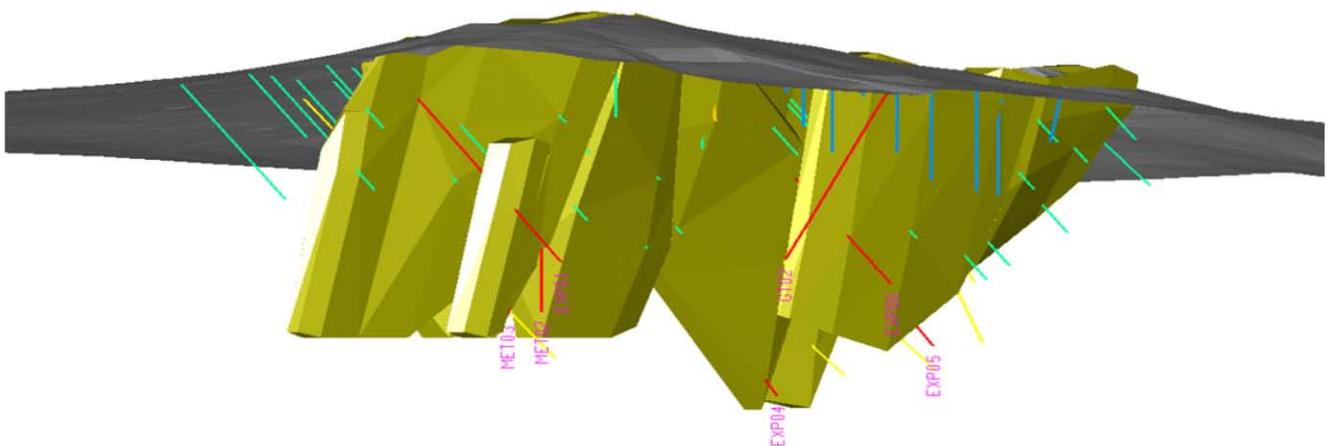

Figure 3 - Oblique view (looking 345°) of updated subsurface mineralisation interpretation with current and historical drilling colour coded by campaign : red = IRM RC (2013) & green = Perseverance (1994)

In addition to the head grade fire assay Au results on which resource re-estimation, metallurgical test work and final pit optimisations will be based, ICP analysis also produced some anomalous copper, silver and zinc intersections confirming the multi-element potential of the Heathcote Greenstone mineralised system. The most significant of these intersections for each hole are listed in Table 3.

While these results are not perceived to have a bearing on the economic potential of the proposed Golden Camel development, the presence of anomalous copper, silver & zinc could have exciting connotations for future geological modelling and target generation given the company's extensive coverage of the Heathcote Greenstone Belt and large historical database.

Hole	Commodity	Anomalous Intersections
GTC02	Silver	2m @ 3.0g/t Ag (34-36m)
EXP04	Copper	3.8m @ 0.41% Cu (50.1-53.9m) <i>Incl. 1.3m of voids</i>
MET02	Copper	15.5m @ 0.28% Cu (32.5-48m)
	Silver	26.5m @ 1.65g/t Ag (20.5-54m) <i>Incl. 1m of voids</i>
	Zinc	5.5m @ 0.11% Zn (38-43.5m)
MET03	Silver	36.5m @ 1.75g/t Ag (22.5-59m) <i>Incl. 6m of voids</i> Incl. 4m @ 4.41g/t Ag (39.5-43.5m)
	Copper	17m @ 0.39% Cu (35-52m) <i>Incl. 5m of voids</i> Incl. 4m @ 0.81% Cu (39.5-43.5m) Incl. 0.5m @ 1.81% Cu (42.5-43m)
	Zinc	2m @ 0.14% Zn (21.5-23.5m) 3m @ 0.14% Zn (70-73m)
EXP01	Silver	8m @ 1.50g/t Ag (6-14m) Incl. 4m @ 2.50g/t Ag (10-14m) 4m @ 2.33g/t Ag (22-24m) <i>Incl. 0.5m core loss (22.5-23m)</i>
EXP05	Copper	1m @ 0.21% Cu (30.5-31.5m) 1m @ 0.26% Cu (39.5-40.5m)
EXP06	Silver	2m @ 2.50g/t Ag (10.5-12.5m)
	Copper	1.5m @ 0.27% Cu (64-65.5m)

### PRELIMINARY PIT OPTIMISATION STUDY

Iron Mountain engaged Crystal Sun Consulting Ltd (Hong Kong) to undertake preliminary pit optimisations for the Golden Camel Project in order to determine whether potential margins at this early stage were sufficient and robust enough to justify ongoing development costs in a climate of fluctuating gold prices. The strategy was to undertake a set of preliminary pit optimisations followed by a final optimisation study using geotechnical and metallurgical data from the 2013 diamond drilling program and a re-estimated resource for the deposit.

The preliminary optimisation study assumed the following criteria (see Table 4) against seven AUD gold price scenarios at \$100/oz increments between A\$1300/oz - A\$1900/oz.

Category	Assumptions
MINING & ORE TRANSPORT	<ul style="list-style-type: none"> <li>*Grade Control</li> <li>*Contract Load/Haul</li> <li>*Contract Drill/Blast</li> <li>*Waste Overhaul</li> <li>*Day works</li> <li>*Rehabilitation</li> <li>*Pit to ROM</li> <li>*ROM to Plant</li> <li>*Ore Transport</li> <li>*Pit Slopes</li> </ul>
PROCESS & ADMINISTRATION	<ul style="list-style-type: none"> <li>*Processing</li> <li>*Maintenance</li> <li>*Gold Recovery</li> <li>*Other</li> </ul>
EXCLUSIONS	<ul style="list-style-type: none"> <li>*IRM Site Management/Tech Services</li> <li>*Toll Treatment/Ore Purchase</li> </ul>

Table 4 - Key assumption criteria used in preliminary pit optimisations for the Golden Camel Project.

The results of the preliminary pit optimisation study by Crystal Sun Consulting were very encouraging and confirmed that potential project margins were sufficiently robust to warrant ongoing development towards a decision to mine. Preliminary pit optimisation shells colour coded at A\$100/oz gold price increments are depicted in Figure 4 and give a visual presentation of the likely scale of the potential development. The proposed preliminary pit shells under consideration are likely to be approximately 300m long (N-S) and 150m wide (E-W). The company anticipates that the forthcoming final pit optimisation study will generate a moderately refined outcome as a result of pending geotechnical, metallurgical and resource re-estimation results.

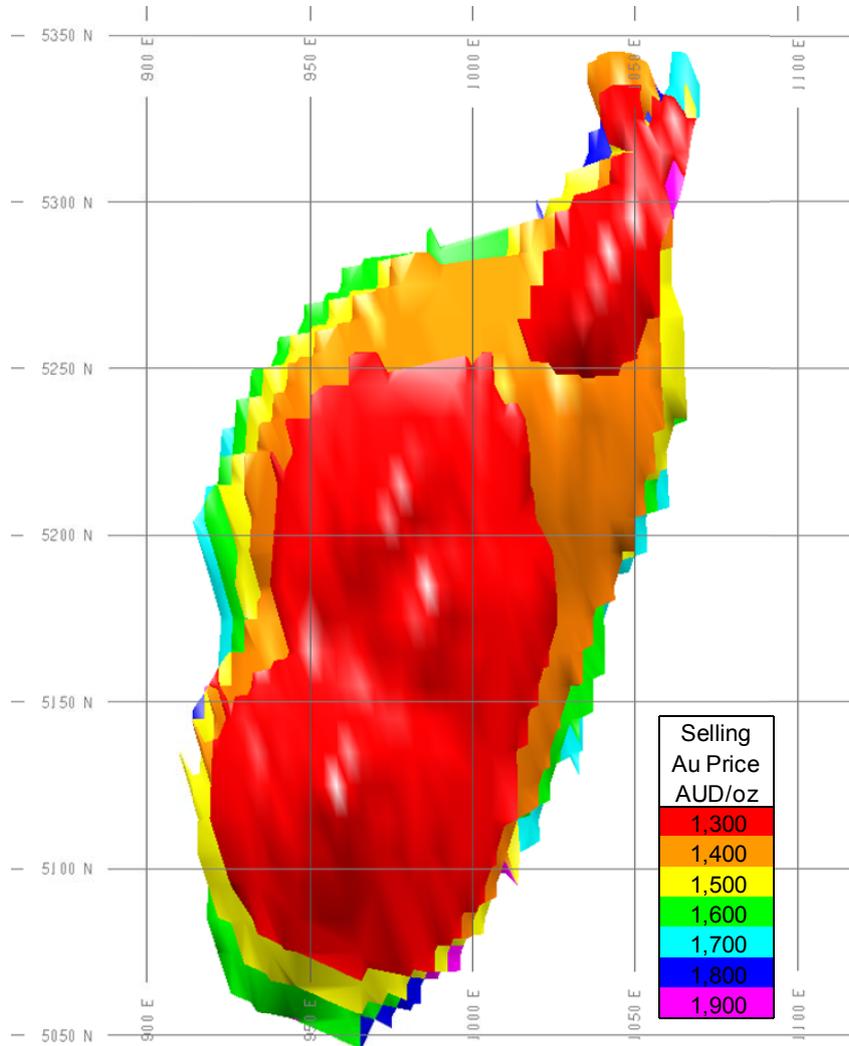

Fig.4 - Preliminary pit optimisation shells for A\$1300-A\$1900/oz gold price scenarios using maiden resource estimate over historical mine grid.

**METALLURGICAL TEST WORK**

Batching of bulk samples has been completed following the receipt of head grade/ICP results from metallurgical samples from holes MET02 and MET 03 and metallurgical test work has commenced. Head grade results revealed that hole MET02 did not contain mineralisation at sufficient grades and intervals to batch an economically viable bulk sample for test work. Fortunately the grades and intervals of mineralisation in hole MET03 were sufficient to batch two samples to undergo the required metallurgical test work (see Table 5). Although a sample of sulphide mineralisation was unable to be provided, the bulk of the potential ore is expected to be sourced from the oxide and transitional zones of mineralisation. Additional drilling may be required should results from the oxide and transition test work deliver variable or inconclusive results. All residual diamond core and samples are to be retained for future metallurgical test work as required.

Hole	Type	Batch Head Grade	Batch Weight
MET03	Oxide	3.99g/t Au	37.38kg
MET03	Transition	1.10g/t Au	30.24kg

Table 5 - Details for selected MET03 batched bulk samples for metallurgical test work.

As previously noted, the metallurgical test work is critical to determine and understand the suitability of the Golden Camel mineralisation for potential processing through a non-specific plant under a toll treatment or ore purchase agreement. The metallurgical samples will be subjected to grind, leach, floatation and recovery test work as well as full ICP analysis. Metallurgical test work results are expected in September and will be reported as received.

### GEOTECHNICAL INVESTIGATION

Geotechnical Investigation Reports covering the preliminary geotechnical assessment of proposed open pit mining at Golden Camel have been received from AMC Consultants Pty Ltd and Peter O'Bryan & Associates. The geotechnical reviews were based on preliminary planning indicating an open pit to a maximum of 60m. The reports address optimal pit design and stability requirements and include recommendations for Face Height, Face Angles and Berm Widths and intervals for the East Wall, West Wall and End Walls.

This information is currently being reviewed by the company with a view to possibly refining some of the outcomes. The approved results will then be sent to Crystal Sun Consulting for use in final pit design and preparation of an appropriate mining schedule to be used to procure a detailed earthmoving quote and subsequently generate a detailed cash flow analysis for consideration ahead of a decision to mine.

### MINERAGRAPHY STUDY

At the company's request, McArthur Ore Deposit Assessments Pty Ltd (MODA) undertook thin section mineragraphic assessment on three diamond core samples that were collected and dispatched prior to head grade assays being received following the unexpected occurrence of stringer, disseminated and massive sulphides in some of the drill core. The three samples in question were all collected from hole EXP01 which was the southern-most hole of the 7 hole (538.8m) drilling program (see Fig.1). Details of the samples with subsequent head grades are provided in Table 6.

SAMPLE	HOLE	DEPTH	ROCK TYPE	HEAD GRADE
A	EXP01	67.95m	Chert	0.12g/t Au & 4g/t Ag
B	EXP01	67.45m	Chert	0.12g/t Au & 2g/t Ag
C	EXP01	70.45m	Basalt	0.02g/t Au

Table 6 - Details of drill core samples submitted for mineragraphic and petrographic thin section analysis.

The minerals identified in **Samples A and B** in approximate descending predominance are as follows:

- Quartz SiO<sub>2</sub> (cryptocrystalline “chert”, coarse-grained veins, fibrous)
- Pyrite FeS<sub>2</sub> (dominant *melnikovite*, framboidal, coarse annealed)
- Carbonaceous matter C
- Rutile TiO<sub>2</sub> (rare)
- Chalcopyrite CuFeS<sub>2</sub> (very rare)
- Pyrrhotite Fe<sub>1-x</sub>S (very rare)
- Sphalerite (Zn,Fe)S (very rare)
- Covellite CuS (very rare)

The overall composition of **Samples A & B** is summarised in Table 7. The dominant form of pyrite in both samples A & B is a primitive, low-temperature, porous melnikovite. The form of melnikovite pyrite present in these samples (commonly seen in many deposit types) can contain elevated levels of gold (<10ppm). Regrettably, this gold is generally sub-microscopic and extremely difficult to recover. In some deposits, where this melnikovite pyrite is recrystallised, visible gold can be found at the crystalline pyrite grain boundaries.

**Heathcote Greenstone Prospect Composition Vol%**

Sample	Py	Me	Po	Cp	Sp	CM	Ru	Qz
A	6.2	41.0	Tr	Tr	Tr	0.1	Tr	52.7
B	8.2	22.3	Tr	Tr	Tr	0	0	69.4

Py=crystalline pyrite, Me=melnikovite pyrite, Po=pyrrhotite, Cp=chalcopyrite, Sp=sphalerite, CM=carbon, Ru=rutile, Qz=quartz. Tr=<0.05vol%

Table 7 - Summarised mineragraphic composition of Samples A & B from Golden Camel (MODA 2013).

Chalcopyrite/Covellite blebs 3-20µm across occur in both samples hosted by coarse, annealed pyrite. Rarely, these are seen to have oxidised to covellite. Similar to chalcopyrite, pyrrhotite blebs 2-20µm and sphalerite blebs 5-20µm occur in both samples hosted by coarse, annealed pyrite (see Fig.5). In some cases, these pyrrhotite blebs are arranged zonally within the pyrite crystal. **Samples A & B** could be interpreted as being indicative of a distal, low-temperature silica-pyrite exhalative with typically elevated precious metals.

**Sample C** is a strongly altered and veined, aphyric, former basaltic lava or shallow dyke rock with poor textural preservation and little or no preservation of primary minerals. The strong quartz-chlorite-dominated hydrothermal alteration and vein assemblages in this rock are far more intense than expected from regional low-grade (burial) metamorphism, and presumably record strong hydrothermal alteration, probably close to or within a significant structural/fault zone.

Given the complete head grade gold and ICP results that were received following the dispatch of Samples A, B & C for thin section analysis, further mineragraphic work is warranted. Key zones of mineralisation are likely to be targeted to hopefully gain a better understanding of the depositional and structural setting of the deposit and to identify any mineralogical relationships that could assist with future target generation.

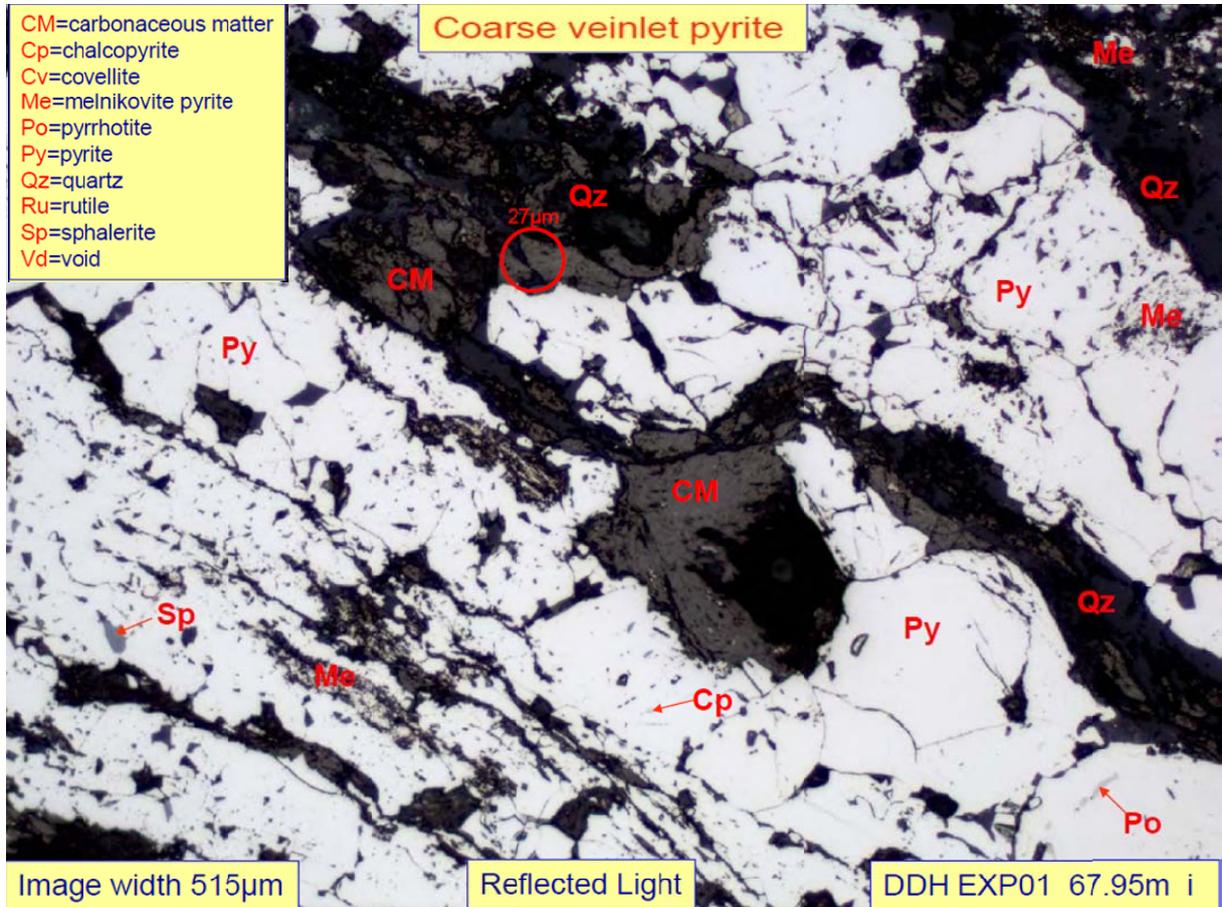

Fig.5 - Magnification of a coarse pyrite veinlet from within Sample A.
