Extensive Gold Mineralisation Discovered at Terminator

South Boulder Mines Ltd (ASX: STB) is pleased to announce that recent aircore drilling (4m composite sampling) at the Terminator Prospect has returned high gold grades of up to 22.10 g/t over 2 metres (EOH) as well as broad zones of gold mineralisation including 64m @ 1.24 g/t from surface.

- Mineralisation is currently well defined over ~ 400m strike, is open in all directions and occurs within a broader anomalous zone over 3km. Numerous holes have finished in gold mineralisation;
- Highlights include;

TBAC 024

- 64m @ 1.24 g/t from surface;
including 12m @ 4.13g/t from surface;

TBAC 025

- 28m @ 2.68 g/t from 52m;
including 8m @ 7.40g/t from 72m;

TBAC 031

- 6m @ 7.84 g/t from 48m;
including 2m @ 22.10 g/t from 52m (EOH);

TBAC 019

- 60m @ 0.70 g/t from surface;
including 8m @ 2.00g/t from surface;
and 4m @ 3.17g/t from 56m

- Approximately 60% of results from Terminator Program outstanding.
- Thompsons Bore gold results to follow.
- 1m re-samples to follow.

A recently completed aircore drilling program at the Terminator Gold Prospect within the Duketon Project comprising 50 holes for 4,216m has discovered significant gold mineralisation. Assay results have been received for 22 holes (28 pending) and results have intersected widespread laterite and oxide mineralisation. The program has confirmed the potential for a significant gold system identified from the initial discovery hole, TBAC111 (37m @ 2.18g/t Au from 1m).

The laterite mineralisation occurs immediately below a thin 1m to 4m blanket of transported cover. The surface and extensive oxide gold zones are evident over large widths down hole. The samples have been taken as 4m composites and these will be re-sampled immediately once all assays have been received. It is expected that one metre re-sampling will significantly improve the grades.

The drill program targeted a sheared contact between an ultramafic and mafic sequence, which is currently believed to be the control on the gold mineralisation. The majority of holes were drilled to blade refusal and fenced on a 40m x 40m pattern. In addition a number of closer spaced holes (20m X 20m) were drilled to understand the vectors to mineralisation. Some wider spaced exploratory drill holes were completed as well as a small program at Thompsons Bore with results to follow.

Hole No.	East (m)	North (m)	RL (m)	Azi. (degr.)	Dip (degr.)	E.O.H.	From	To	Interval (m)	Au (g/t)	Comment

Table 1 – Compositated assay results from first pass aircore drilling at the Terminator Gold Prospect.

Note: Assays have been determined by the Aqua Regia ICP_MS method. Samples were collected as 4m composites. Results have been rounded where appropriate. Intervals are expressed as down hole intervals in metres. There is insufficient information at present to make an estimation of the true width of the mineralisation encountered.

Duketon Belt Gold Potential

The Duketon Belt contains highly prospective geological sequences and mineralised structures. Numerous structures are known to contain significant gold mineralisation. This is evidenced by the approximately 3 million ounces of unmined gold resources currently defined to date within the belt. In addition the plus 1.5 million ounce Moolart Well Gold Project is currently being developed by Regis Resources Ltd (ASX: RRL). Once operational this will be only mining operation in the Duketon Belt.

Very little systematic gold exploration has been completed within The South Boulder Duketon Gold Project. From the early 90's the majority of the Duketon Project was held by Normandy Mining Limited and Newmont Mining Corporation. Although wide spaced reconnaissance exploration was sporadically conducted, the vast majority of the project remains under shallow cover and vastly under explored.

About the Nickel Joint Venture

In early 2004, South Boulder entered a farm-out Joint Venture (JV) Agreement with Independence, whereby Independence can earn a 70% interest in the nickel rights on tenements held by South Boulder in the Duketon Project, by the completion of a Bankable Feasibility Study within 5 years of grant of the relevant tenements. The Duketon Project covers around 1800km² and is highly prospective for gold, nickel sulphide and base metal deposits. South Boulder holds 100% of the gold and base metal rights.

About South Boulder Mines Ltd

Listed in 2003, South Boulder Mines (ASX: STB) is a diversified explorer primarily focused on gold, nickel, potash and phosphate.

More information:

Lorry Hughes
Managing Director
South Boulder Mines Ltd
+ 61 (8) 9227 1144

This ASX release has been compiled by Lorry Hughes using information on exploration results supplied by South Boulder Mines Ltd and Independence Group who are the operator of the Duketon Nickel JV. Lorry Hughes is a member of the Australian Institute of Mining and Metallurgy. Mr Hughes has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2004 Edition of the "Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Lorry Hughes consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.
