

8 March 2018

MOUNT ROMMEL MINING LTD

Directors of the Company wish to advise shareholders and the market generally as follows –

- The 100% owned subsidiary company BONSHAW GOLD PTY LTD is holder of EL006473. Its application to commence work on that licence has been assessed, and found to fully satisfy all pre-requisites enabling diamond drilling to begin at North Clunes.
- Accordingly, Mount Rommel Mining Ltd arranged for the commencement of drilling from a site on Clunes Common, about 100 metres east of Downes Road.

This hole has been planned to become a special purpose hole, intended to core through a prospective environs for gold.

This environs has been well indicated by records from percussion drilling in March, 1986 (WMC hole CP 130) and in January, 1996 (MIM-Alliance JV hole MCR-8) both of which stopped while in gold-bearing mineralisation. The horizontal distance between CP 130 and MCR 8 is at least 90 metres.

The intention of Directors is to provide progress reports to the market, as events down-hole reveal information which warrants disclosure.

The location under test is the immediate north end of the former New North Clunes gold mine, a mature mine closed for commercial purposes in year 1894. Data currently available suggests a blind prospective zone of significant extent warrants coring, the space being that between worked zones, and yet separated from old workings.

Work at site began 6 March, 2018. The photo below confirms commencement, and illustrates the environs of this location. The photo is looking to NNE.
