

## **Lavra Drilling Update**

### ***Potential for Stacked Mineralisation Demonstrated***

#### **Highlights**

- **Drilling has demonstrated the possibility of stack lodes at Lavra**
- **Stacked lodes will significantly increase the potential for further mineralisation at the Lavra project**
- **Level of depletion by artisanal miners appears to be low at shallow depths, providing confidence towards minimal depletion at depths**
- **Drilling has been put on hold early due to faulty equipment, and is planned to be restarted as part of a significantly larger program in the near future**
- **Peak intercept from limited assays to date is 2m @ 7.1gpt from surface**

Cleveland Mining Company Ltd (ASX: CDG) is pleased to provide an update of the progress of the small drilling program that was previously announced to have commenced at the Company's Joint Venture O Capitão Lavra project in Goiás State, Brazil.

Drilling has been instigated to extend the current Inferred Resource of 134 kt @ 11.14 g/t Au for 48 kOz. Currently two pits are optimised containing a maximum of 44,000 t @ 14.4 g/t gold, for 20,400 Ozs gold (assuming no artisanal depletion). However, there remains a zone between the pits known as the Saddle Area that could not be added to the mine plan due to a lack of drilling, as shown on Figure 1 (circled area).

A program of 18 holes has been designed, and drilling was expected to be completed in less than 1 week. Unfortunately, drilling has been slower than expected due to significant shortcomings with the RC rig's compressor. As a result, drilling has temporarily been suspended and will recommence as part of a significantly larger program which is planned for the near future.

To date, 9 out of 18 holes have been completed and assay results coming through have included 2m @ 7.1g/t Au from 0m (ground surface) in hole CGPRC00007. In addition, the Company's conceptual interpretation of Lavra's lode geometry has advanced as a result of this drilling and the concepts, if proved, will have significant, positive economic ramifications.

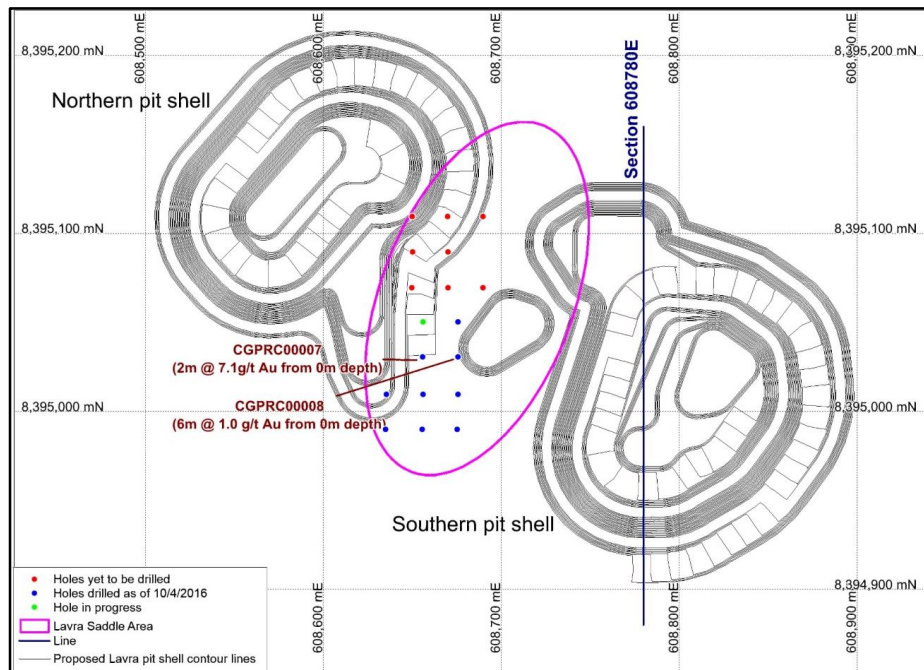

Figure 1, Collar locations and hole status, Saddle Area, pit shells & position of Section 608780E

The Saddle Area offers the potential for 47 to 94 kt @ 6 to 11 g/t Au for approximately 9 to 33 kOz, assuming mineral grade and width is consistent with the grade and width of the neighbouring and adjoining resource.

Each hole so far drilled has either intersected mineralisation at two levels, or intersected 'fill' (spoil left after artisanal mining) or voids (artisanal underground workings) where mineralisation would otherwise have been expected. Drilling has tested the area to a maximum depth of 24m and, even at this modest depth, is intersecting consistent mineralisation (or artisanal workings) at two levels; one being near surface (0 – 5m depth) and another located between 15 and 20m depth.

At this stage of drilling, the grade trend appears to be increasing as drilling progressively moves northward, with holes CGPRC00007 and CGPRC00008 returning intersections of 2m @ 7.1g/t Au from 0m depth and 6m @ 1.0 g/t Au from 0m depth, respectively.

Company geologists report that the drilling results have reflected a much improved understanding of the extent of garimpo depletion. They estimate that, based on drilling so far, approximately 70% of the mineralisation in this area is still intact. Given that the drilling was into the shallowest area, and thus the easiest for artisanal miners to access, the observations provide confidence that depletion should be further reduced at depth.

Garimpeiros who previously worked at Lavra but who are now helping with the drilling say that they, in fact, worked multiple levels at Lavra down to and beyond 120m depth. Drilling so far certainly indicates 2 levels of mineralisation within the top 24m, somewhat validating the garimpeiro claims.

The current Lavra model consists of a single lode system, but now it appears Lavra is probably multilayered, and if so offers significant, positive, economic ramifications, as the outcome would be

enhanced ore potential, compared with the current single lode model, and subsequently a reduced strip ratio.

Based on the multilayered concept and past and new drilling information, company geologists now tentatively interpret at least three mineralised horizons within 60m of ground surface, as shown on Figure 2; being the Upper Target, Lower Target and the Fill Zone.

Figure 2, Section 608780E

The Fill Zone was intersected in the current drilling as artisanal workings presumed to have originally been occupied by mineralised material that was removed and replaced by backfill, but which still probably retains mineral potential away from the current drilling down dip or along strike.

It must be emphasised that the multilayered model is conceptual and requires substantiation by drilling in addition to that currently in progress.

Cleveland would like to make clear that this suspension of drilling was not an issue caused by the drilling company, who despite that poor quality compressor, still managed to complete half the program. Cleveland decided to terminate the program early, to ensure funds were not wasted on having idle machinery and people. The Company is still working to undertake a major drilling program and will complete the remainder of this small program as part of that campaign.

## About Cleveland Mining Company Ltd

Cleveland Mining Company Ltd is an Australian-managed, ASX-listed minerals company squarely focused on developing projects into mines.

The Company's management team has a track-record for building billion-dollar projects from the ground up, providing Cleveland with the expertise to secure and build robust projects.

Cleveland has gold and iron ore assets in Brazil in areas with excellent mining credentials:

- Mining and production are underway at Cleveland's Premier 50/50 Gold Mine JV in Goiás State in central Brazil. The Company is working to add throughput from the O Capitão project, which is less than 10km from the Premier Mine.
- The companies have signed binding Option Agreements with the Brazilian private company Bahmex covering multiple iron projects.

Cleveland has a different approach to project selection with project economics driving target selection. Projects are chosen according to their likelihood of generating returns at the bottom of the economic cycle.

## Forward-looking Statements

Forward-looking statements can be identified by the use of terminology such as 'intend', 'aim', 'project', 'anticipate', 'estimate', 'plan', 'believe', 'expect', 'may', 'should', 'will', 'continue' or similar words. These statements discuss future expectations concerning the results of operations or financial condition, or provide other forward looking statements. They are not guarantees or predictions of future performance, and involve known and unknown risks, uncertainties and other factors, many of which are beyond our control, and which may cause actual results to differ materially from those expressed in the statements contained in this ASX update. Readers are cautioned not to put undue reliance on forward looking statements

## Competent Person's Statement

The information in this report that relates to Exploration Results is based on information reviewed by David Mendelawitz, who is a Fellow of the AusIMM. Mr Mendelawitz has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Mendelawitz consents to the inclusion of the matters based on his information in the form and context in which it appears. Mr Mendelawitz is employed by Cleveland Mining Company Ltd.

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	Sampling at Lavra was by RC drilling.  Drilling was completed by Infogeo Drilling contractors and sample collection by Cleveland Premier employees.
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	Drill hole collars are picked-up by company surveyors. Drill samples were logged for lithology, weathering, wetness and contamination by company geologists. Sampling was carried out under Cleveland protocols and QAQC procedures as per industry best practice.  Certified standards and blanks were inserted into the sampling sequence at a nominal rate of 1 standard in every 20 samples and 1 duplicate in every 60 samples. Results from the QAQC sampling were considered acceptable.
	<i>Aspects of the determination of mineralisation that are Material to the Public Report.</i>  <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	Drill samples are collected directly from a riffle splitter bucket fed from the cyclone outlet.  All samples were prepared and assayed at the Premier mine laboratory by aqua regia digest. Select samples were submitted to SGS Belo Horizonte for fire assay. All samples are crushed, dried and pulverised (total prep) to produce a sub sample. Aqua regia was by 30gm digest with an AAS finish. Fire assay was by 30gm charge and AAS finish.
<b>Drilling techniques</b>	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core</i>	Drilling was to a depth of between 15 and 34m using a face sampling hammer bit. No downhole surveying was conducted.

Criteria	JORC Code explanation	Commentary
	<i>is oriented and if so, by what method, etc).</i>	
<b>Drill sample recovery</b>	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	All samples were weighed immediately upon recovery from the cyclone. The sample weight was recorded and captured in the company database.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	Rock chip recoveries within oxide material are lower than the fresh material. Drillers are instructed to reduce the penetration rate in an attempt to increase recovery.  Cyclone and sample buckets are cleaned between rod-changes and after each hole to minimise downhole and/or cross-hole contamination.
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Cleveland protocols and QAQC procedures are followed to preclude any issue of sample bias due to material loss or gain. No significant bias is expected and any potential bias is not considered material at this stage of resource development.
<b>Logging</b>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	Sample logs record lithology, mineralogy, mineralisation, weathering, colour, lithology, grainsize, texture, contamination, oxidation, weathering and wetness of the samples. Chip trays are photographed and the rock density of select samples estimated as part of the assaying process.  Logs are recorded graphically and entered into Cleveland database.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Samples were photographed within chip trays.
	<i>The total length and percentage of the relevant intersections logged.</i>	All drill holes were logged in full to end of hole.
<b>Sub-sampling</b>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	Not applicable.

Criteria	JORC Code explanation	Commentary
<b>techniques and sample preparation</b>	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	Samples were riffle split immediately from the cyclone discharge. On the rare occasion of a sample being wet, then it was grab sampled from numerous positions around and within the coarse sample.
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Preparation of exploration samples was performed at the Premier mine assay laboratory. Samples were dried, crushed to 80% passing 10 mesh (i.e. 2mm), homogenized, riffle split (primary split) and pulverized to 95% passing of 200 mesh (75 microns).
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	Cleveland Mining quality control procedures included submission into the sampling sequence certified reference material, field duplicates (check sampling of coarse rejects) and check assaying of 1 in every 20 samples such that blanks are inserted at the rate of 1 in every 60 assay samples, standards inserted 1 in every 60 assay samples and duplicates inserted 1 in every 60 assay samples.  Laboratory quality control procedures include the submission of blanks, duplicates and standard reference material. Typically, for every 34 to 36 samples, a pulp duplicate, coarse reject duplicate, reagent blank and an aliquot of certified reference material is inserted into the sample stream. All QC results are reported within the final assay report.
	<i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Duplicates were taken at a rate of 1 in every 60 samples and submitted into the sample sequence.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample size is deemed appropriate relative with the grain size based on industry standards of similar mineral styles and sampling methods.
<b>Quality of assay data and</b>	<i>The nature, quality and appropriateness of the assaying and laboratory</i>	For all samples, gold assays were determined by aqua regia using 30gm solution and AAS finish. Select samples were analysed by fire assay with a 30g

<b>Data aggregation methods</b>	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p>	<p>The intersection in CGPRC00004, 1m @ 2.0 g/t Au from 3m depth.</p> <p>The intersection in CGPRC00005, 1m @ 3.0 g/t Au from 5m depth.</p> <p>The intersection in CGPRC00007, 2m @ 7.1g/t Au from 0m depth.</p> <p>The intersection in CGPRC00008, 6m @ 1.0 g/t Au from 0m depth.</p> <p>Grade intersections averaged uncut assays taken at 1m intervals. Greater than 1g/t Au intersections only.</p>																																																																						

Criteria	JORC Code explanation	Commentary
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	
<b>Relationship between mineralisation widths and intercept lengths</b>	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></p>	Drilling intersected mineralisation at high angle and as close as practicable to true thickness.
<b>Diagrams</b>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Refer to figures contained within the announcement body.
<b>Balanced reporting</b>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	Comprehensive reporting of results from drill holes CGPRC00001 to CGPRC00008 & CGPRC00010 has been achieved in this announcement.
<b>Other substantive exploration data</b>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	There is no other material data to report.

<b>Further work</b>	<p><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	Additional drilling is planned to close off mineralisation.
