

ASX RELEASE

3 May 2022

JV DRILLING SCHEDULED FOR HAWKWOOD NI CU CO AU PGE IN QLD

- **A ~2,100m drill campaign is planned to begin shortly across the Project Area (Schedule 2).**
- CML has worked through the Auburn Resources Ltd (AUB) database covering the Hawkwood JV area and agreed on the first-pass drilling as described in this announcement to be arranged and managed by AUB under the JV as soon as practically possible in the second quarter 2022.
- **The Hawkwood JV comprises 13 granted EPM's covering approximately 1,680km² that includes several drill ready prospects,** or that can be advanced to drilling after minor surface programmes.
- **Eight new magmatic nickel copper PGE targets** defined in previously unexplored gabbro complexes.
- **Two new porphyry copper targets** have been recognised, with one ready for initial drilling.
- **A 12km zone of anomalous copper gold palladium and platinum** in a layered gabbro is drill ready.

As announced on 27 October 2021 Chase Mining Corporation Limited (**CML or the Company**) entered into a joint venture (JV) option agreement with private Company Auburn Resources Ltd (**AUB**) which gives it the opportunity to explore an entire new district of potential large-scale copper nickel cobalt gold PGE (palladium and platinum) prospects in central SE Queensland 350km north-west of Brisbane. Over several years AUB has acquired a package of 100% owned adjacent exploration tenements (EPMs) in the largely covered portion of the Permo Triassic mineral belt of southern and central Queensland. The area had been subject to little exploration prior to AUB's activities.

The early start to an exceptional La Niña wet season and localised flooding in late 2021 prevented any ground access to the project area and AUB as the JV operator was not able to locate suitable geophysical contractors to complete the planned ground EM surveys to better define the existing VTEM targets.

NICKEL COPPER GOLD PGE (PLATINUM AND PALLADIUM) TARGETS

By applying modern geochemical techniques and a local geological understanding AUB identified the source areas of copper, nickel, gold and PGEs that had been detected in stream sediments (See Schedule 4 Appendices 1 to 7 for sample and assay data). This led to an entire trend of highly anomalous mafic complexes being defined and secured under granted EPMs (Figures 1, 2 and Schedule 1).

The nickel copper gold PGE source areas have been partially investigated by airborne electromagnetics surveys (VTEM), with depth persistent conductors detected adjacent to the peak geochemical values. The bedrock in these localities is shallowly buried under veneers of sediments, and require drill testing, and further local geophysical surveys.

The mafic complexes with peak nickel geochemistry and adjacent underlying conductors are the Jack Shay gabbro, the Quaggy gabbro, and the inferred totally covered Calrossie gabbro.

The more southerly Delubra layered gabbro contains layers enriched in copper gold platinum and palladium, without nickel.

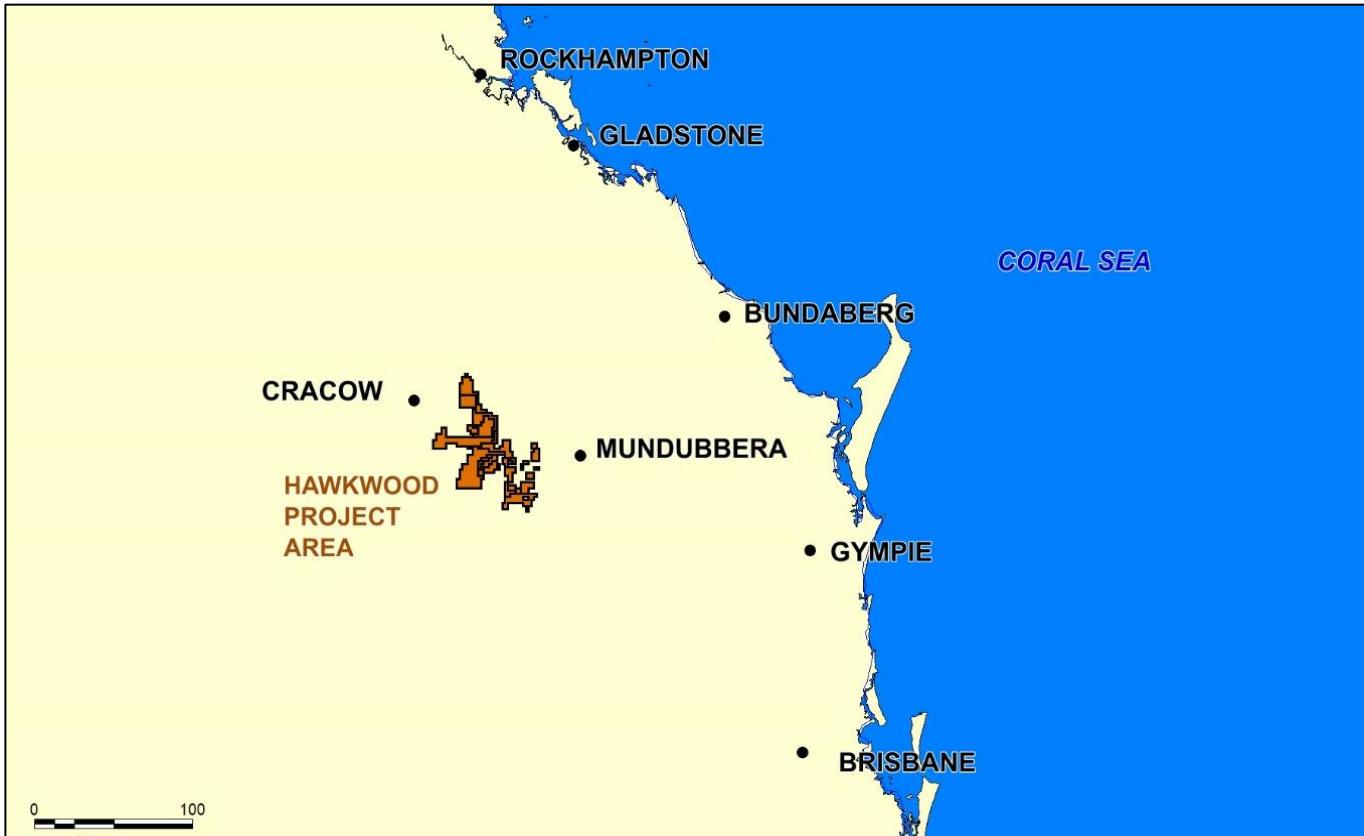

Fig. 1 Location of Hawkwood Project

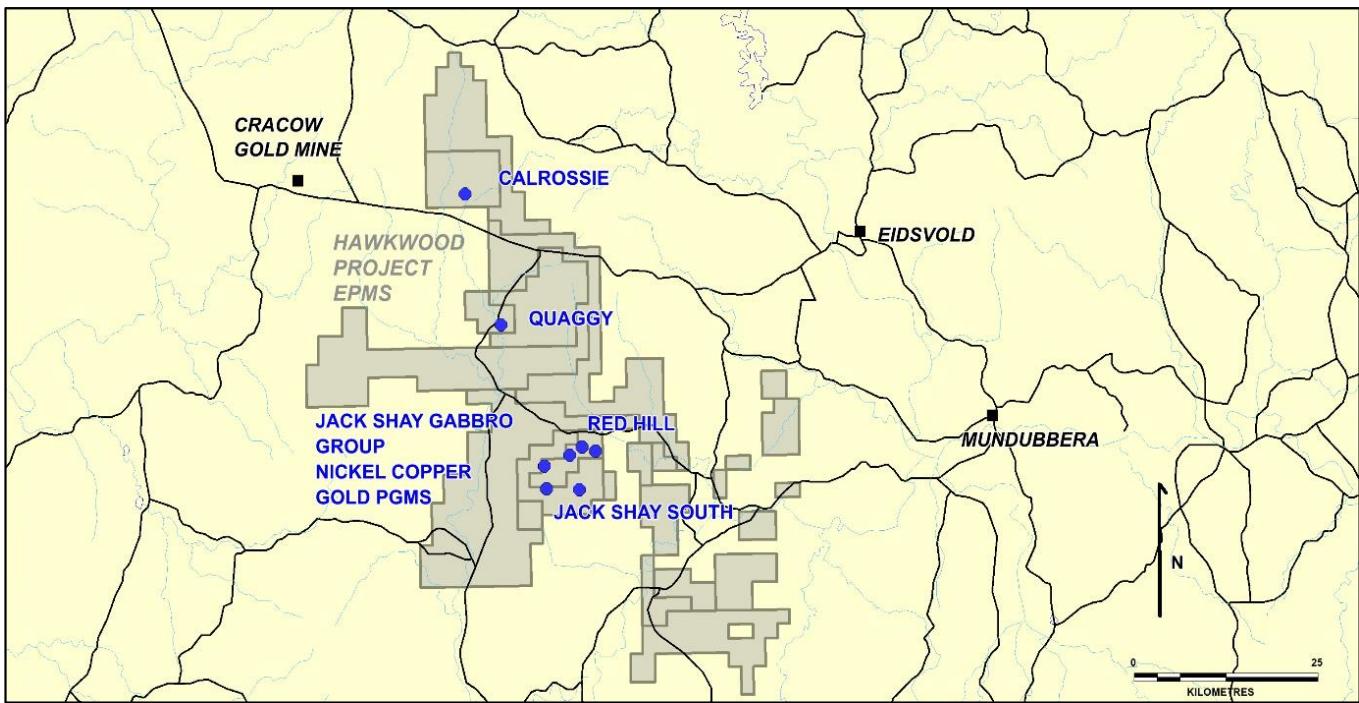

Fig. 2 Hawkwood Project Nickel Copper PGE targets.

The Jack Shay gabbro has several large geochemical - geophysical targets distributed around the inside margin of the mafic intrusive complex. These are interpreted as extensive depth persistent zones of disseminated and stringer sulphides related to strongly magnetic intrusive phases.

The Quaggy target, about 20km to the north, is a very intense conductor interpreted at 1 Ohm. This implies a large body of massive sulphides and has been selected for drilling in early 2022.

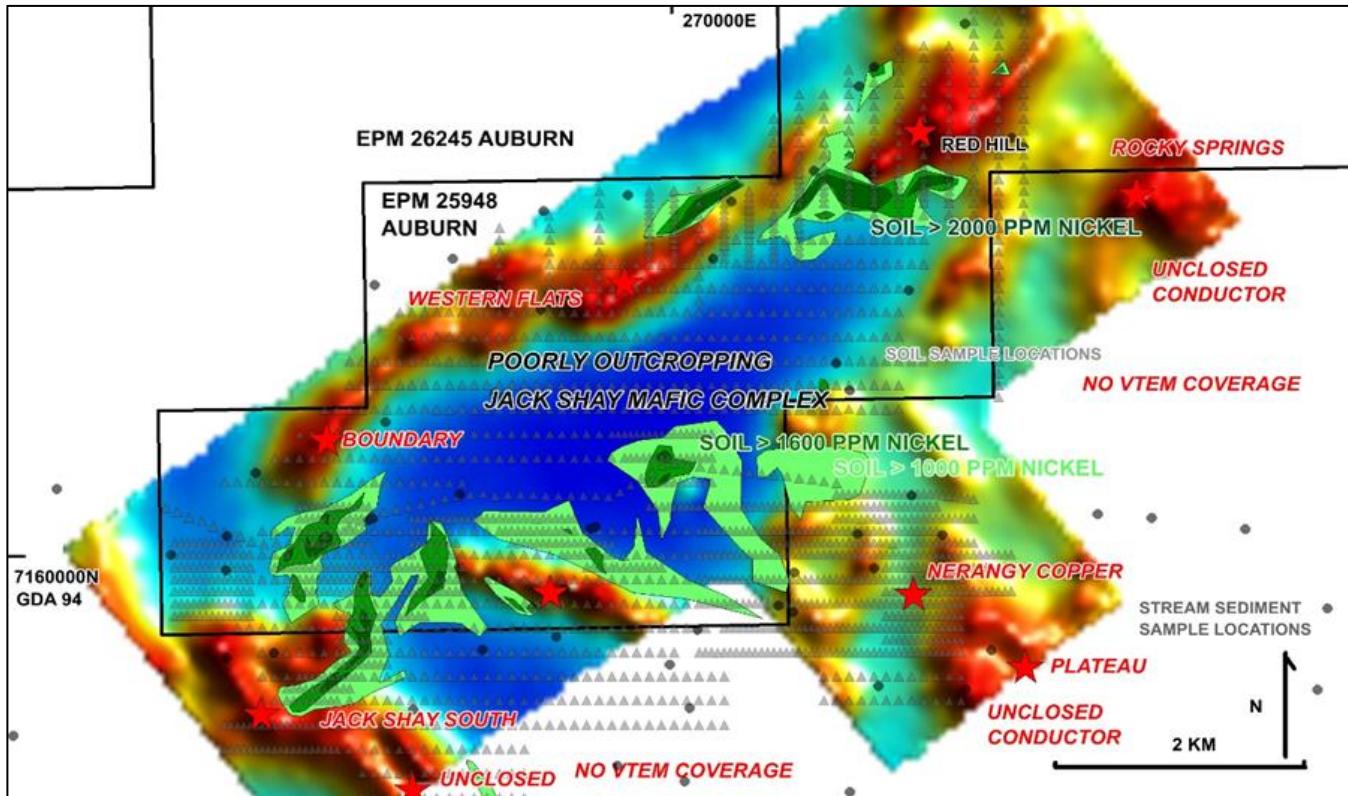

Fig. 3 Targets within the Jack Shay Gabbro, defined by VTEM and surface nickel geochemistry. Note that the VTEM survey did not cover the entire Jack Shay intrusive complex.

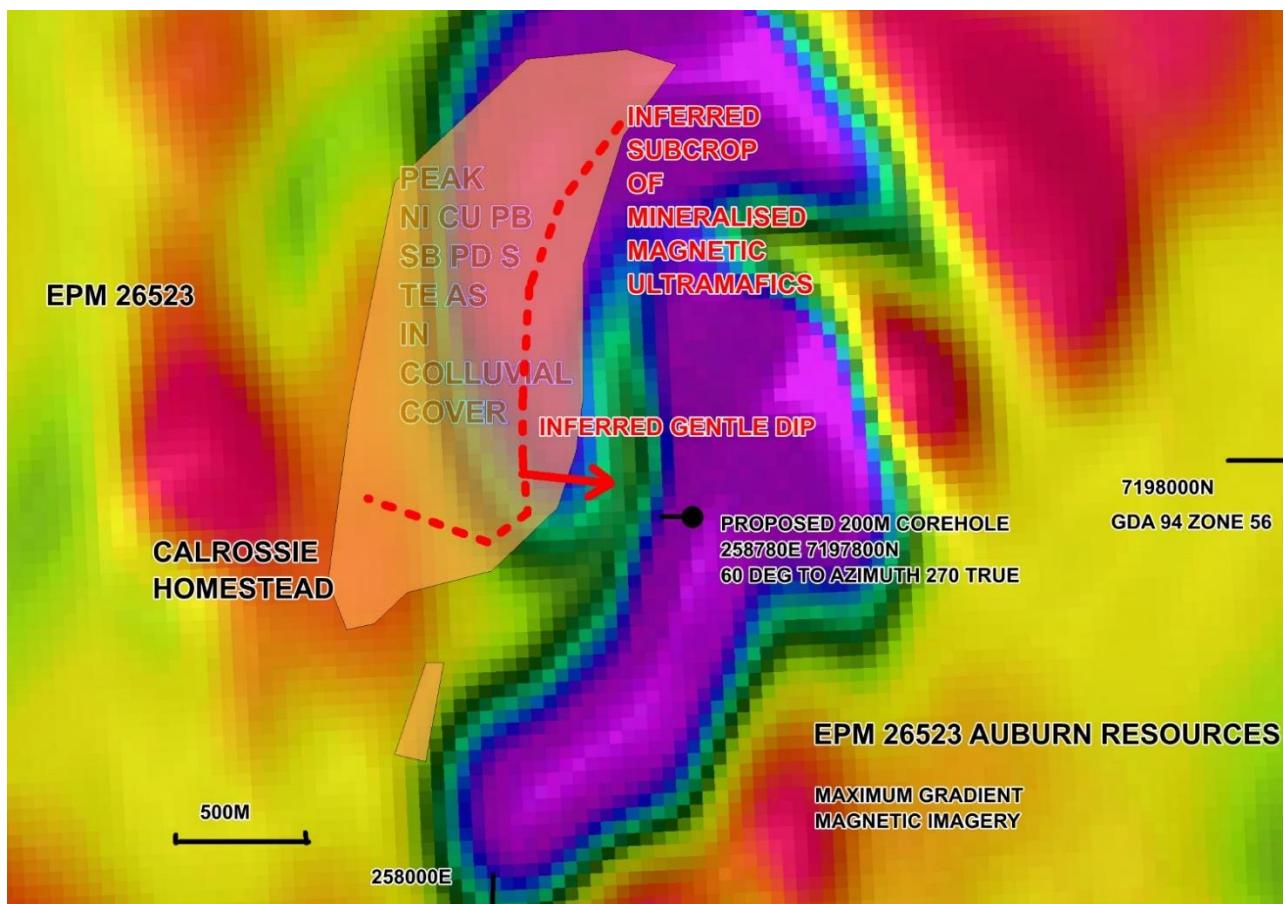

Fig. 12 Calrossie Target on Magnetic Imagery. The intense anomaly is typical of ultramafic host rocks

PORPHYRY COPPER TARGETS

Two areas of strong copper molybdenum gold geochemistry have led to the recognition of new porphyry copper systems at Nerangy, and TiTi Creek.

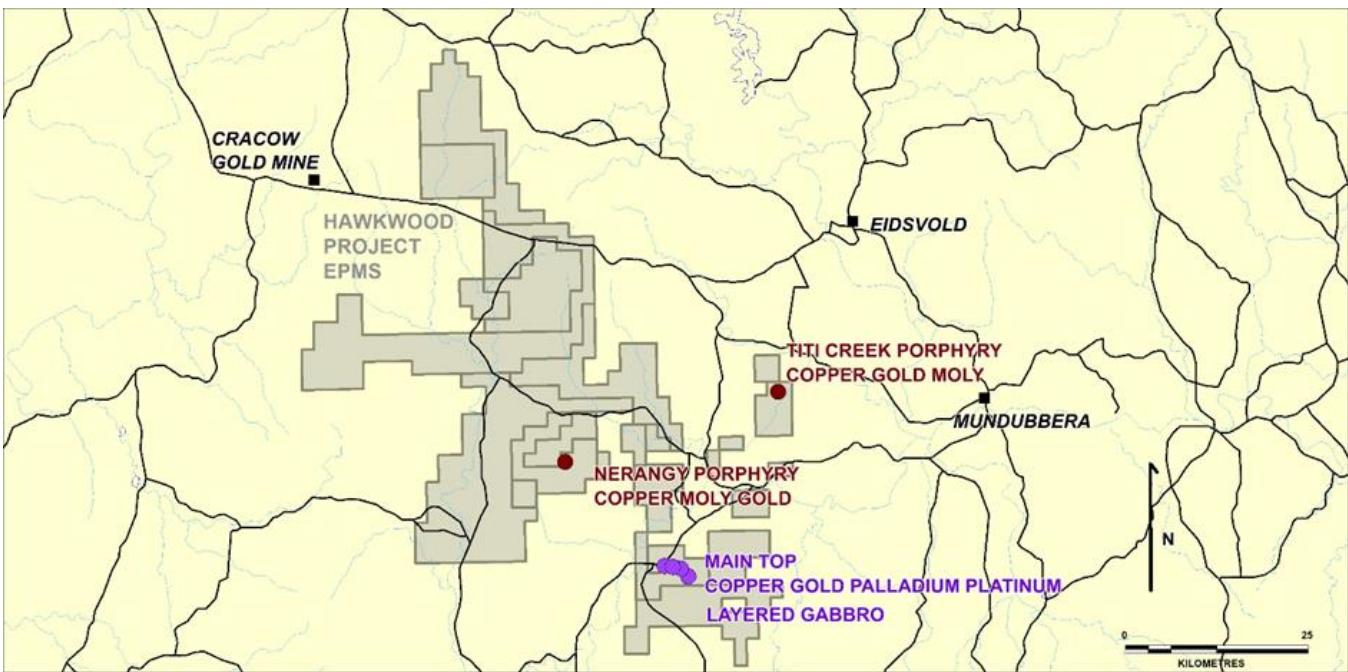

Fig. 13 Hawkwood Project Copper Targets.

Nerangy:

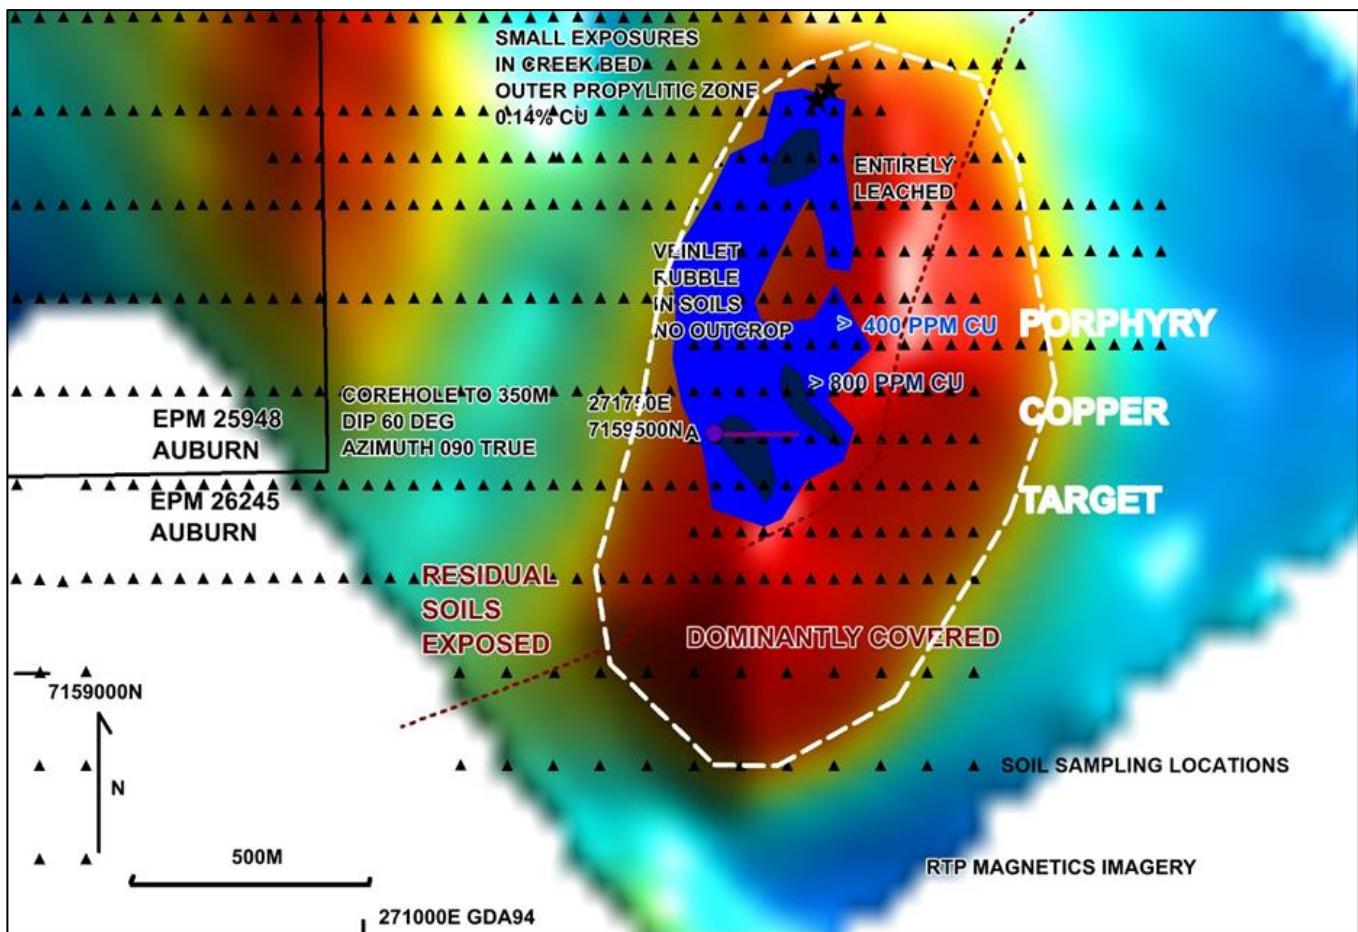

Fig. 14 Nerangy Porphyry Copper Target and proposed CML drilling.

Nerangy is a drill ready target, with a coincident 1.5km x 800m copper molybdenum soil geochemistry and magnetic target. Only a small marginal portion of this entirely leached porphyry system outcrops in a gully at the northern end (Figures 15 and 16). The residual soils in the centre contain abundant veinlets, typical of the centres of porphyry deposits. Molybdenite was noted in the veinlets, but the copper has been leached. The total leaching of visible copper from the surface implies that an enriched copper blanket will be developed around the level of the water table. Copper grades at depth below the level of leaching should be much higher.

Fig. 15 Sole Outcrop (on the northern propylitically altered margin) – Nerangy Porphyry

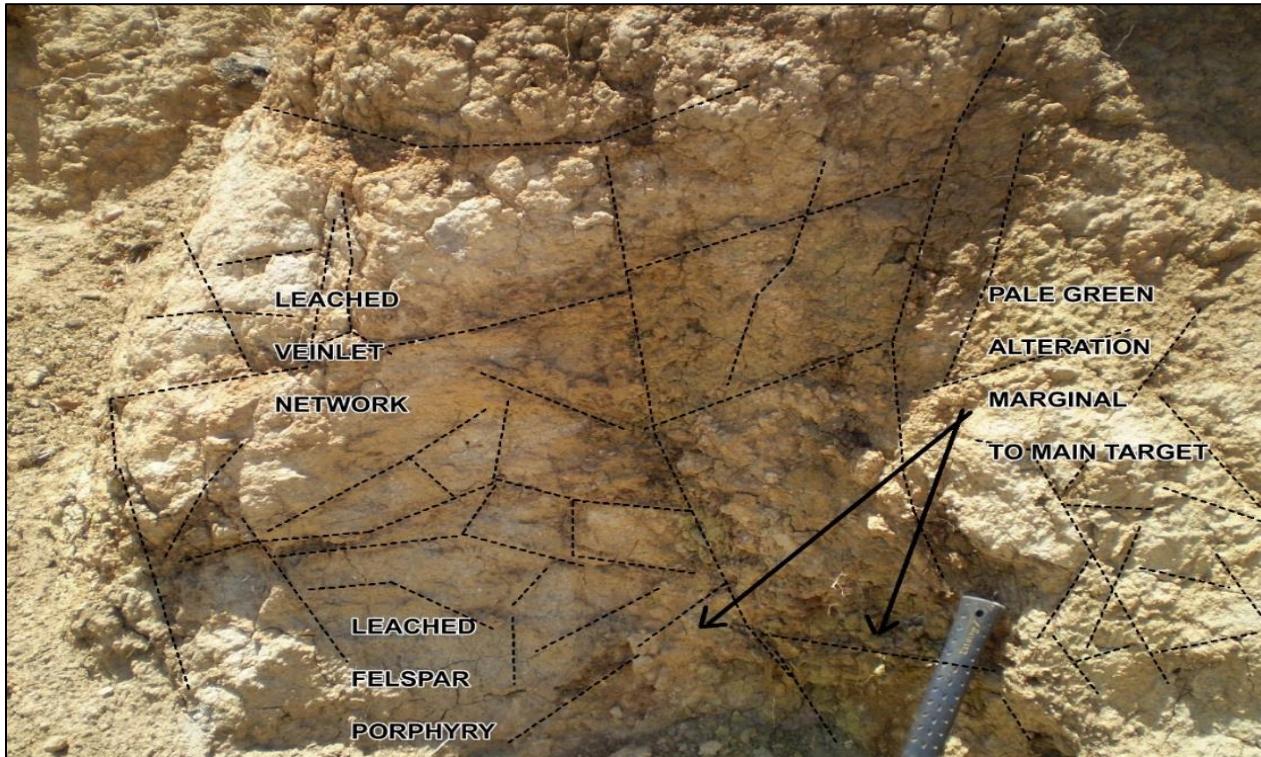

Fig. 16 Close-up of the veined leached outcrop in Fig. 15

Titi Creek is an extensive area of copper gold (cobalt molybdenum) mineralisation including old diggings. In places there are intrusive porphyries and breccias with veinlet and disseminated sulphides. Much of the area is obscured by various cover sediments, and the target needs to be defined and confirmed by more sampling and mapping.

COPPER GOLD PLATINUM PALLADIUM

In addition, the southernmost of the Auburn mafic complexes, the Delubra Gabbro has been shown to have major potential for copper with gold platinum and palladium. This layered intrusive which has been described by the Queensland Geological Survey, as Skaergaard in style, was very sparsely drilled (for magnetite mainly) previously.

The full width and extent of the copper PGE layer in this intrusion was never tested by any historic drilling (results not substantiated). CML intends to drill through the mineralisation in an area of maximum surface copper and scattered old diggings at Main Top.

The Main Top area of old diggings at the better exposed western end of the target has been chosen for initial diamond drilling (Figures 17 and 18).

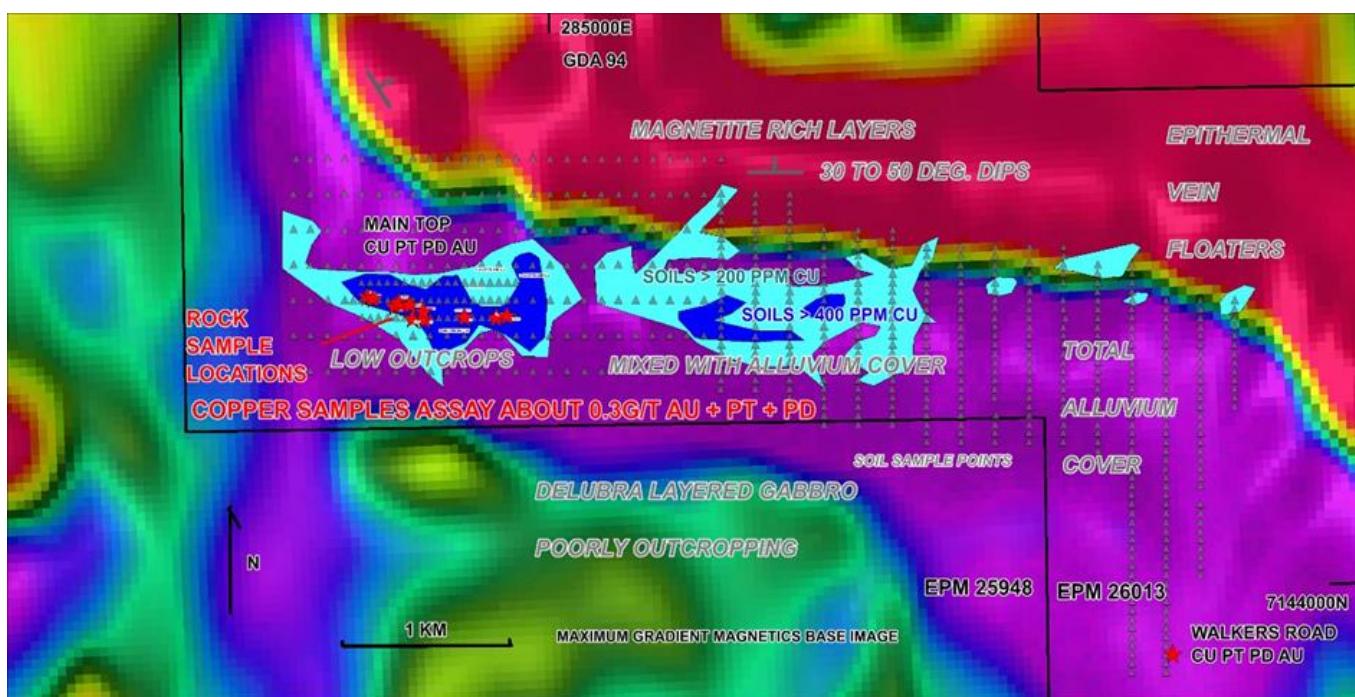

Fig. 17 Full Extent of the Main Top Copper Gold PGE target. Dips vary between 10 and 50 degrees north within the layered gabbro.

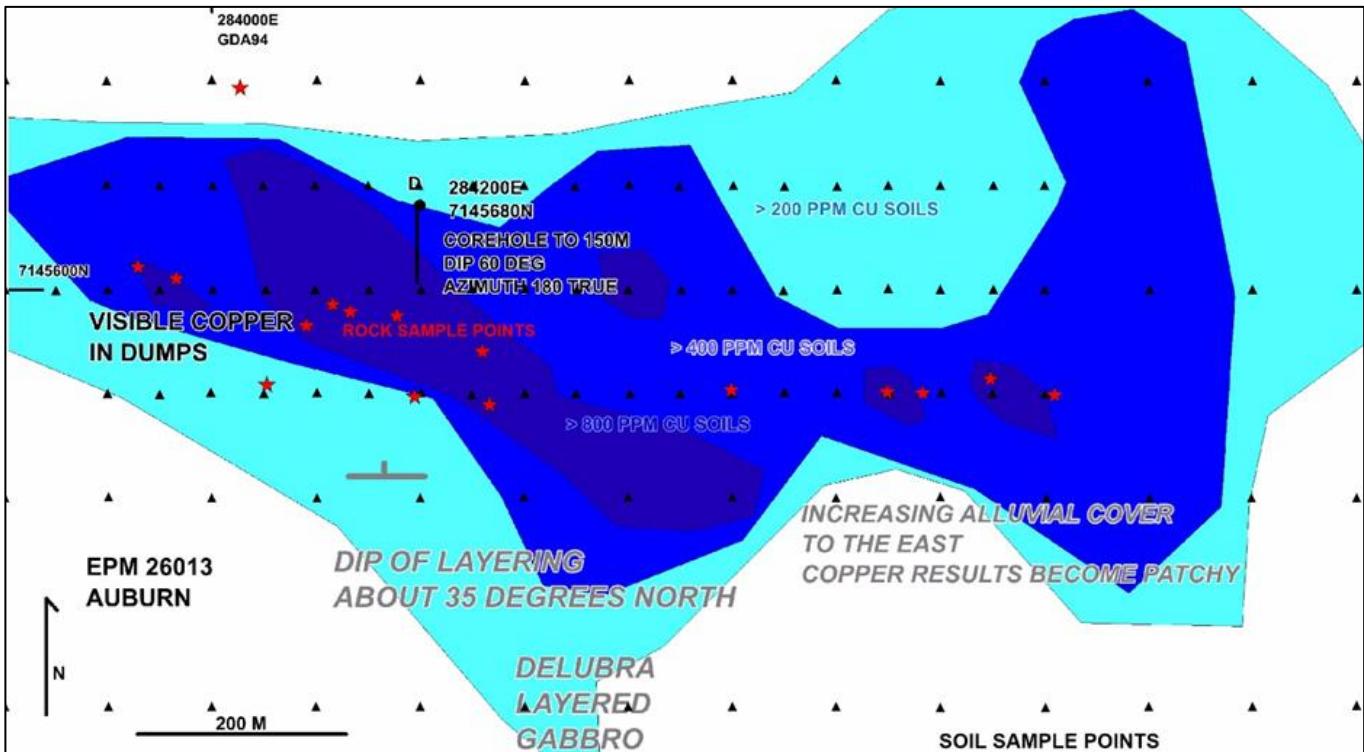

Fig. 18 Main Top Copper Gold PGE and proposed CML drilling.

Fig. 19 Old collapsed shaft and dumps Main Top. The proposed CML drilling is designed to test this material at depth.

Fig. 20 Main Top diggings - discarded low-grade material assayed 0.43% copper and 0.35 g/t combined gold platinum palladium. CML is targeting a very large tonnage of similar grade, with included higher grade layers.

This announcement has been authorised for release to the ASX by the CML Board of Directors.

COMPETENT PERSON STATEMENT

The information in this release that relates to exploration results and exploration targets is based on information compiled by Mr Neil Wilkins M.Sc Exploration and Mining Geology, who is a Member of The Australian Institute of Geoscientists and is employed by Ascry Pty Ltd.

Mr Wilkins has visited the area and prospects and has more than five years' experience which is relevant to the style of mineralisation and type of deposit being reported and to the activity, which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves' (the JORC Code). This public report is issued with the prior written consent of the Competent Person as to the form and context in which it appears.

Mr Wilkins holds shares in CML.

SCHEDULE 1 - HAWKWOOD PROJECT TENEMENTS

General description

The Hawkwood Project is located approximately 55km's west of Mundubbera and 55km's southeast of Cracow. The project comprises 13 granted EPM's that cover approximately 1,680km². All tenements in the project are held 100% legally and beneficially by Auburn Resources Ltd and is the Holder for all statutory purposes.

| Tenement Details | | | | | | | Project |
|------------------|--------------------|--------|-----------|-----------|----------------------|------------|--------------|
| EPM | NAME | STATUS | GRANTED | EXPIRY | PRINCIPAL HOLDER | SUB-BLOCKS | PROJECT AREA |

Schedule 3:

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sampling techniques | <ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> | <ul style="list-style-type: none"> Stream sediment sampling involved -4mm sieving of active sediment sites located by GPS. All analyses were done by ALS laboratories. Soil sampling at all locations other than Calrossie involved sieving to -4mm the samples taken at 10cm depth. A handheld GPS recorded the locations. These were of alluvial cover and rarer bedrock derived soils. The geology of the district means that many soil sample sites were from either of alluvium, basal alluvium carrying metals, and of residual soil. At Calrossie, the total alluvial cover was sampled by hand auger to refusal, the depth and locations were recorded. In all cases, about 1 kg of sieved material was used for analyses. As the soil samples were taken along grids and roadsides, they are considered representative of the varying materials sampled. The localities selected for soil sampling were in strongly anomalous drainage catchments, and areas of old workings. Rock samples were from selected material in outcrop, alluvial float, and old mine dumps. |
| Drilling techniques | <ul style="list-style-type: none"> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> | <ul style="list-style-type: none"> No drilling |
| Drill sample recovery | <ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> | <ul style="list-style-type: none"> No drilling |
| Logging | <ul style="list-style-type: none"> <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate</i> | <ul style="list-style-type: none"> No drilling |

| Criteria | JORC Code explanation | Commentary |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <p><i>Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <ul style="list-style-type: none"> • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. | |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the <i>in situ</i> material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. | <ul style="list-style-type: none"> • No sampling |
| Quality of assay data and laboratory tests | <ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. | <ul style="list-style-type: none"> • The Calrossie and Quaggy samples were crushed split and pulverised at ALS Laboratories in Brisbane and analysed by Mass Spectroscopy after full acid digests. • ALS have internal systems of blanks and duplicates. • The generations of stream sediment first pass soil and second pass infill soils have consistent results that verify the targeting technique - in several elements. • The soil samples at Jack Shay, Main Top, and TiTi Creek, were firstly in house analysed for copper and nickel by hand held Delta Premium XRF with four readings. Only the median reading was selected. • In local areas of interest generated by the XRF results, infill sampling and duplicates of the XRF samples were analysed by mass spectroscopy by ALS Laboratories in Brisbane. These results included other elements such as cobalt gold palladium and platinum not amenable to XRF. • The validity of the XRF technique used was verified by the ALS duplicates and later infill samples. For copper and nickel, the XRF does read consistently higher by about 20%, but this consistent over reading is far less than the natural unavoidable variations caused by the nature of materials sampled. |

| Criteria | JORC Code explanation | Commentary |

APPENDIX 6

Rock Sample Locations Descriptions and Analyses

| Sample | EPM | East | North | Type | Size | Oxidation | Comments |
|---------|-------|--------|---------|---------|------------|-------------|---------------------------------------------------|
| DR9919 | 25948 | 278515 | 7167498 | grab | | moderate | ultrabasic near old shaft |
| DR9201 | 25948 | 271549 | 7163015 | float | 5m rad | | glassy limonite |
| DR9202 | 25948 | 271549 | 7162957 | float | 10m rad | very strong | magnesite silica network typical of UB |
| DR9203 | 25948 | 269450 | 7163044 | subcrop | 30m strike | strong | large vein boxworks |
| DR9207 | 25948 | 272291 | 7162998 | o/c | 20m | moderate | feldspar dyke |
| DR10211 | 25948 | 270301 | 7159789 | float | 2m rad | weak | isolated float |
| DR10212 | 25948 | 270258 | 7159916 | float | 3m rad | weak | fg to mg plag spar intrusive |
| DR10213 | 25948 | 270260 | 7159914 | float | grab | strong | fg to mg plag spar intrusive, box work |
| DR10214 | 25948 | 270227 | 7160458 | float | 3m rad | strong | |
| DR10215 | 25948 | 270730 | 7160447 | outcrop | 10m NW | weak | fg mafic intrusive |
| DR10217 | 25948 | 270638 | 7159742 | float | 5m rad | weak | fg mafic intrusive |
| DR10223 | 25948 | 267151 | 7160137 | float | 1m rad | mod | fg, ferrug, ironstone, small area float |
| DR10224 | 25948 | 267112 | 7160126 | float | 2m rad | mod | schist/ironstone mg |
