BONANZA GRADES of 83.3g/t GOLD FROM EDIE CREEK VEIN

Niuminco Group Limited (“Niuminco” or “the Company”) is pleased to announce **bonanza grades of 83.3g/t gold from a newly discovered vein** in the Ingopae area of Edie Creek, approximately 200metres south of the camp compound (see Figure1 below).

Figure1: Sampling at the newly discovered vein south of the old Ingopae “pit” (in the foreground).

Following bulk sampling of a vein near the Edie Creek valley floor in the same area last week by Niuminco’s geological field team, workings were done at night by illegal artisanal miners some 80metres to the south-west of, and parallel to, this vein.

Niuminco's team then moved to bulk-sample this new, narrow, northeast-southwest running vein after exposing it further both along and down strike.

Over the three days 10 to 12 September, **2.6 tonnes of the vein material have produced 218.7g (7.0 ounces) of gold**, with sampling and processing continuing. This gold and **191.2g (6.1ounces) of silver** was produced from **882g of wet (not retorted) amalgam**, which is a typical ratio for Edie Creek vein materials (**22-25% gold and 20-25% silver as a percentage of the wet amalgam**).

Figure2: 318g of wet amalgam produced at Edie Creek on Wednesday

Yesterday's (Thursday, 13 September) sampling and processing has **produced 1909g of wet amalgam** which will be refined and sold today (see Figure3 and Figure4 below).

Figure4

Figure3 on the left shows one of Thursday's batches of wet amalgam **weighing 1600g** and Figure4 on the right the same amalgam in the panning dish.

Managing Director, Tracey Lake said;

“This vein, which appears to be one of a series of parallel veins, further indicates the historical evidence of increasing grade in the Edie Creek systems as you move deeper down towards bedrock. We look forward to further sampling results from this area in coming days whilst we continue to develop and mine the Edie Lode and Surmans vein systems.”
