

## In-fill assay results for HWDD03 (Horse Well Prospect)

### Highlights:

- 51 additional samples submitted for assay following detailed re-logging of the drill core.
- Despite visual identification of chalcopyrite in the core the assays did not return any anomalous copper metal values.
- The area remains a high prospectivity target with a number of components supporting proximity to an IOCG system.

Cohiba Minerals Limited (ASX: CHK, 'Cohiba' or 'the Company') reports on in-fill assay results for HWDD03 at its Horse Well Project in South Australia (Figures 1 and 2) as a follow-up from the detailed geological logging of the drill core.

**Cohiba's CEO, Andrew Graham says,** "Following on from detailed re-logging of all of the drill core from HWDD03 it was decided that some additional intervals would be assayed where disseminated or blebby pyrite + chalcopyrite were visually identified. The assays did not reveal any anomalous metal values but this area has already shown that it contains a number of components which are highly supportive of proximity to an IOCG system and as such will continue to be a priority for future exploration."

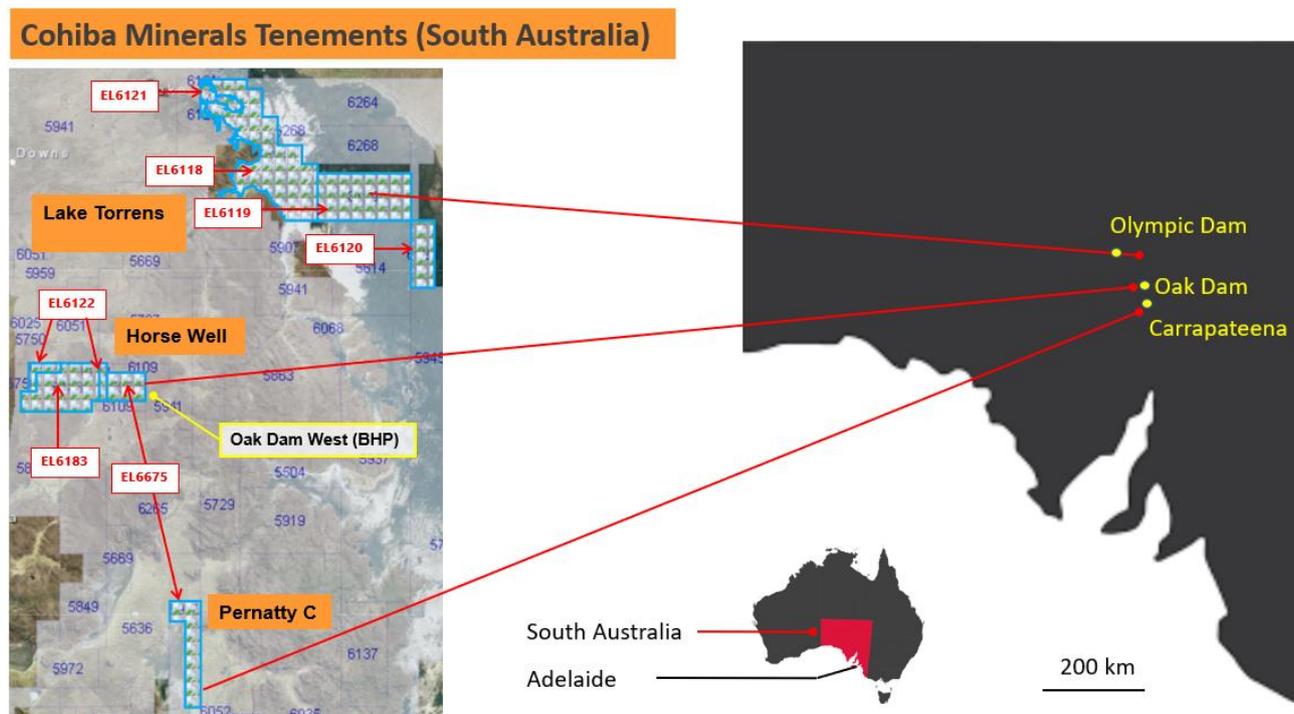

Figure 1: Cohiba Minerals Tenements including Horse Well Prospect and Oak Dam West deposit.

### Address

Level 21  
459 Collins Street  
Melbourne VIC 3000

### Directors

Mordechai Benedikt – Executive Chair  
Andrew Graham – Executive Director  
Nochum Labkowski – NED

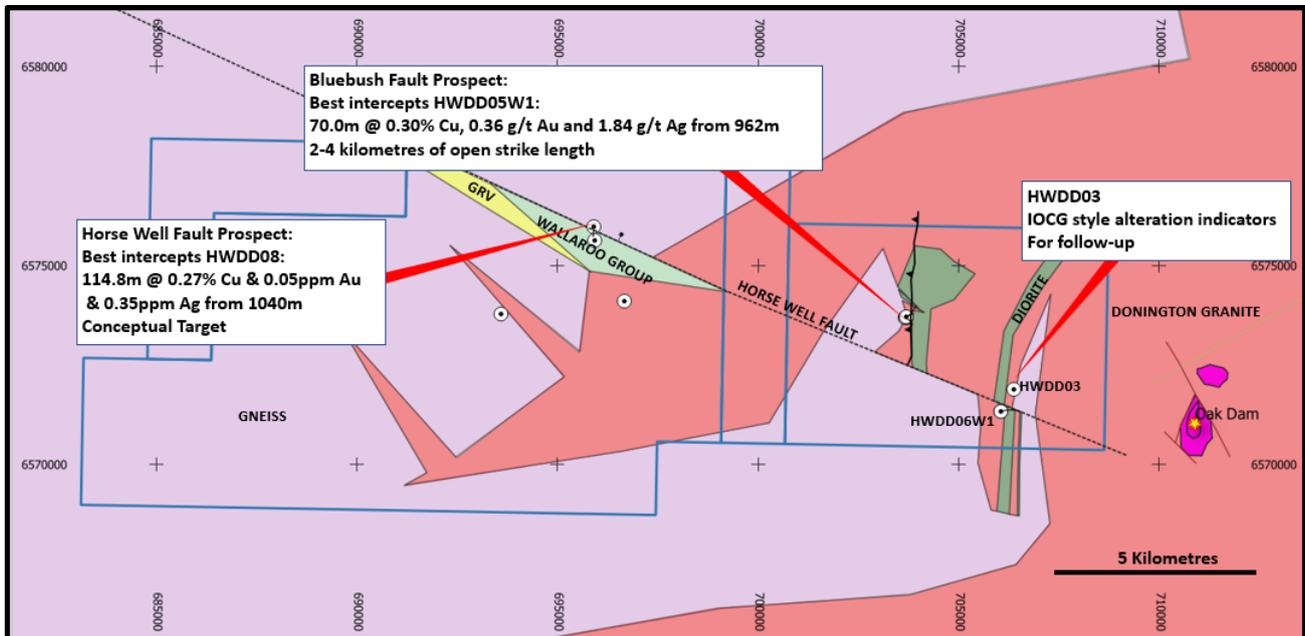

Figure 2: Interpreted basement geology map for Horse Well Tenements with location of HWDD03.

Additional samples were taken from the following intervals:

- 1038 – 1040m
- 1048 – 1054m
- 1078 – 1080m
- 1082.3 – 1102.5m
- 1119 – 1136.7m
- 1156.6 – 1177.5m

At 1044m a 2m thick fault gouge comprising reddish-brown hematite-silica infill, carrying clasts of white quartz and with a weak sericite overprint (3) was encountered. This is typical of barren HEMQ which is commonly the core alteration zone of a mature IOCG system (Figure 3).

The barren HEMQ fault is enigmatic in that this alteration is generally found in the central portion of an IOCG breccia system immediately adjacent to the high-grade chalcocite zone. The recognition of barren HEMQ has been of importance in the discoveries of IOCG systems. It is possible that this fault controlled HEMQ has similar geometry to the stratiform HEMQ at Prominent Hill mine, implying that parts of this fault may be layered with mineralisation.

Disseminated copper mineralisation such as chalcopyrite is rarely observed in the Olympic Domain outside of the IOCG environment, and at Horse Well tenements has nearly always been accompanied by brecciation, and evidence for IOCG preparation.

Figure 4 shows a fresh gneiss with minor sericite alteration and traces of disseminated pyrite and chalcopyrite but this interval (1133-1134m) returned a low copper value of 0.022%.

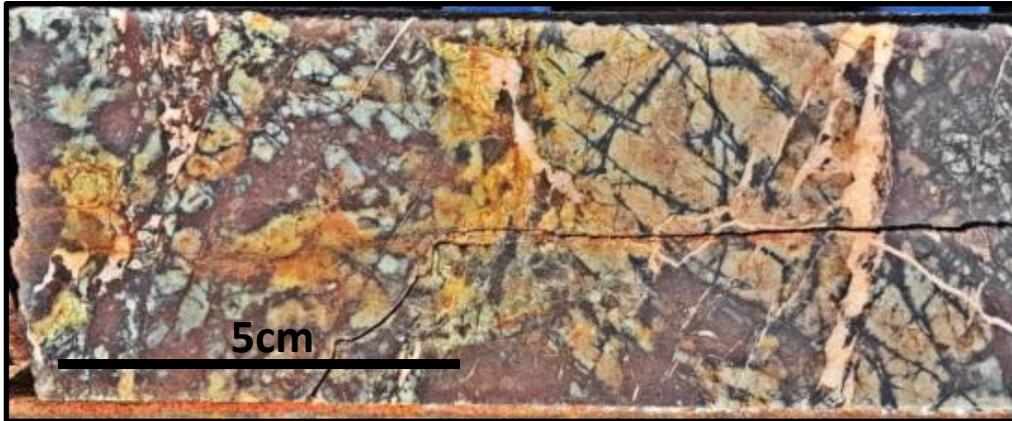

Figure 3: HWDD03 1044.4m. Pale silica with yellow sericite hue, fine crackle with red-brown haematite infill. White siderite stringers.

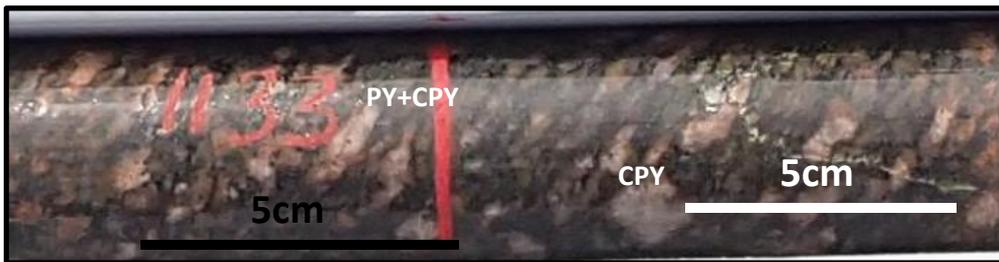

Figure 4: HWDD05 @ 1033m. Fresh gneiss with minor sericite alteration and traces of disseminated pyrite and chalcopyrite (PY+CPY).

The analytical results for drill hole HWDD03 were completed by ALS Laboratories and have been assessed by the company and its technical consultants. The collar location for HWDD03 is outlined in Table 1:

| Hole ID | Easting | Northing | Azimuth | Dip | Collar RL | Hole Depth (m) |
|---------|---------|----------|---------|-----|-----------|----------------|
| HWDD03  | 706374  | 6571895  | 0°      | 90° | 161.3m    | 1,179.7        |

Table 1: Collar locations and depth for drill hole HWD03.

- Ends -

This announcement has been approved for release by the Board of CHK.

**Competent Persons Statement**

*The information in this report / ASX release that relates to Exploration Targets and Exploration Results is based on information either compiled or reviewed by Mr Andrew Graham, who is an employee of Mineral Strategies Pty Ltd and an Executive Director of Cohiba Minerals Ltd. Mr Graham is a Member of the Australasian Institute of Mining and Metallurgy and has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Graham consents to the inclusion in this report /ASX release of the matters based on information in the form and context in which it appears.*

## JORC Code, 2012 Edition – Table

The following table is provided to ensure compliance with the JORC Code (2012 Edition) for the reporting of Exploration Results

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria                   | JORC Code explanation  | Commentary   |
|----------------------------|--|--|
| <b>Sampling techniques</b> | <ul style="list-style-type: none"> <li>• <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li>• <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li>• <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li>• <i>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></li> </ul> | <ul style="list-style-type: none"> <li>• Drillhole HWDD03 comprised reverse circulation (RC) drilling to 377.5m, diamond drilling (HQ size) to 598.6m and diamond drilling (NQ size) to the end of hole at 1,179.7m. The RC drill chips were logged but none of them were submitted for analysis. The drill core was filleted via a diamond saw, with a 2m sampling interval except where adjusted to align with specific geological observations made during logging. Each sample interval was bagged and labelled with a unique identifier prior to submission to ALS Laboratories.</li> </ul> |
| <b>Drilling techniques</b> | <ul style="list-style-type: none"> <li>• <i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method)</i></li> </ul>  | <ul style="list-style-type: none"> <li>• Pre-collar drilling was conducted using reverse circulation (RC) drilling followed by diamond drilling comprising HQ and NQ drill core sizes (standard tube). The drill holes were vertical, and no core orientation was undertaken.</li> <li>• Drillhole HWDD03 comprised reverse circulation (RC) drilling to 377.5m, diamond drilling (HQ size) to 598.6m and diamond drilling (NQ size) to the end of hole at 1,179.7m.</li> </ul>  |

| <b>Geology</b>                           | <ul style="list-style-type: none"> <li><i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>  | <ul style="list-style-type: none"> <li>The drilling at Horse Well was targeting Iron Oxide-Copper-Gold (IOCG) style mineralisation similar to the immediately adjacent Oak Dam West deposit (BHP).</li> <li>The Horse Well project lies in the Olympic Domain on the eastern margin of the Gawler Craton. Younger sediments conceal the crystalline basement rocks of the Craton, which are interpreted as an eroded surface of Archaean, Palaeoproterozoic and Mesoproterozoic rocks. Archaean rocks are represented by metamorphics of the Mulgathing Complex. The Palaeoproterozoic is represented by Donnington Suite granitoids, Hutchinson Group metasediments and rocks of the Wallaroo Group. These older country rocks are intruded and overlain by Mesoproterozoic igneous rocks of the Gawler Range Volcanics. Hiltaba Suite granites, which are co-magmatic with the Gawler Range Volcanics, also intrude the basement rocks (Reidy, 2017). West of Lake Torrens comprises the relatively stable Stuart Shelf. The Stuart Shelf is a platform of Early to Middle Proterozoic rocks on the north-eastern margin of</li> </ul> |

|----------|-----------------------|--|
|          |                       | <p>the Gawler Craton. The Shelf is bounded to the south by the Gawler Range Volcanics and to the east by the Torrens Hinge Zone which lies approximately along the western shore of Lake Torrens. The Pandurra and Adelaidean sedimentary succession directly overly the granitic and gneissic basement and varies in thickness from less than 300m to more than 1000 metres. The Pandurra Formation is the lowermost unit and comprises a fluvial red-bed sequence of arenites and argillites with thin but widespread conglomeratic lenses. The unit was deposited in a NW-SE trending fault-controlled basin across the southern half of the Stuart Shelf. Erosion and glaciation have resulted in considerable topography on the upper surface of the Pandurra Formation (Reidy, 2017). Unconformably overlying the Pandurra Formation is a thick succession of flat-lying Adelaidean sediments namely the Umberatana and Wilpena Groups, respectively. The unconformity represents a hiatus of approximately 700Ma. The Tapley Hill Formation is the lowermost Adelaidean unit on the Stuart Shelf. It comprises dominantly a thinly laminated carbonaceous, partly calcareous siltstone and represents the first transgression onto the Gawler Craton. This marks the change from a rift tectonic style to a sag phase producing an extensive marine basin (Reidy, 2017). The aeolian Whyalla Sandstone gradationally overlies the eroded Tapley Hill Formation and comprises coarse-grained, bimodal sandstone. The onset of glaciation during the Marinoan was accompanied by another sea level fall which resulted in the Whyalla Sandstone (Reidy, 2017). A widespread post-glacial transgression resulted in the deposition</p> |

| Criteria | JORC Code explanation | Commentary   |
|----------|-----------------------|--|
|          |                       | <p>of the Wilpena Group. The lowermost unit is the Nuccaleena Formation, a thin laminated micritic dolomite with interbedded shales in the uppermost unit. It grades up into the Tent Hill Formation comprising the lower Tregolana (Woomera) Shale Member, the middle unit of the Tent Hill Corraberra Sandstone Member and the upper Arcoona Quartzite Member, marking an eastward progradation of shallow water facies (Reidy, 2017). The second major cycle of the Wilpena Group commenced with a rapid marine transgression resulting in the deposition of the maroon silty shale of the Yarloo Shale (equivalent of the Bunyeroo Formation deposited elsewhere in the Adelaide Geosyncline). This is the youngest Adelaidean unit preserved locally on the Stuart Shelf. The Adelaidean rocks are overlain by Cambrian Shelf Facies of the Andamooka Limestone, comprising cavernous, massive Archaeo-cyatha limestone and dolomitic shale, and the Yarrowurta Shale which contains red-brown, purple and green shales and siltstones. These shelf facies are overlain by coarse sands and ferruginous sandstones of the Jurassic Cadna-owie Formation &amp; Algebuckina Sandstone, which thickens to the west. Overlying these units is the Cretaceous Bulldog Shale which outcrops around the northern edge of Lake Torrens. Tertiary deposits of carbonaceous sandstones, siltstones &amp; mudstones (Eyre and Mirikata Formations) and silcrete cap the Bulldog Shale with several outcrops to the north and west of Lake Torrens. Overlying this is varying thicknesses of Quaternary sediments including playa sediments and dune fields (Reidy, 2017).</p> <ul style="list-style-type: none"> <li>• The Olympic Dam IOCG deposit</li> </ul> |

| Criteria                             | JORC Code explanation  | Commentary  |
|--------------------------------------|--|---|
|                                      |  | <p>formed during the Mesoproterozoic Era, in a high level (near surface) geological environment associated with igneous activity that was responsible for the extrusion of the Gawler Range Volcanics and intrusion of the co-magmatic Hiltaba Suite granites, which provided mineralising fluids. Therefore, the ancient geological setting, where older country rocks lie immediately beneath or adjacent to the Gawler Range Volcanics and the intruding Hiltaba Suite granites, was favourable for the deposition of IOCG mineralisation. Like Olympic Dam, Carrapateena and Oak Dam West deposits Cohiba's Horse Well tenements lie within this former high-level volcanic zone, marginal to the Gawler Range Volcanics. The older country rocks in this area include members of the Wallaroo Group, which includes evaporitic units. These rocks may have contributed saline waters to mix with ascending hydrothermal fluids and form the Olympic Dam deposit, according to the evaporite source model for IOCG deposits (Reidy, 2017).</p> <p>Reidy, P. (2017): Independent Geologists Report – Olympic Domain Project South Australia.</p> |
| <p><b>Drill hole Information</b></p> | <ul style="list-style-type: none"> <li>• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>○ easting and northing of the drill hole collar</li> <li>○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>○ dip and azimuth of the hole</li> <li>○ down hole length and interception depth</li> <li>○ hole length.</li> </ul> </li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this</li> </ul> | <ul style="list-style-type: none"> <li>• Drillhole HWDD03 – collar location 706374 E, 6571895 N measured with conventional GPS UTM UPS: Zone J.
